The healing art and preventive science are part and parcel of each other. The cure of disease must be imbued with a preventive element. Scurvy certainly demonstrates this assertion to be true, as in the treatment of this pathological condition, we see the cure emerges directly and exclusively from the preventive treatment, and I have no doubt that as our knowledge increases this principle of physiological treatment as opposed to complicated and disturbing drugs will be more clearly recognized.

If some move to establish better hygienic conditions is not accomplished ere long, and our people taught to appreciate that education of the body is almost of equal value with culture of the mind, the bodies of our people will be starved, and the normal brain become morbid and inactive in the proper direction. The now great American nation will be forced to take a second place regarding health, ability and morality while she will rank high in immorality.

It is a sad mistake to centralize our attention upon the cultivation of the brain, as if it were a separate organism entirely independent of the physical body, and it depends upon our profession to form a public opinion favorable to a supply of pure air and physical exercise, particularly to the poorer classes; and this I exhort you to, as nothing else will maintain the high

standard in our future generations that has been handed down to us by our forefathers.

Fellow physicians, upon reform in sanitary matters, depends the future of this promising nation. Our government has its Secretary of State, of the Navy, of War, of Agriculture, of the Treasury, while the richest treasure of mankind—health, is absolutely ignored. Why do we not have a Secretary of Health. This is a disgrace to us as a people and indirectly a reflection upon our profession, for we undoubtedly have it in our power, if we would insist on our patients and their families paying more attention to sanitary matters.

Knowing, as a physician does, how important health is to human greatness and happiness, our efforts cannot be too great to maintain it. The present year is one of more than usual importance with the dire disease cholera close to our shores. Yet, with the individual exertion of every physician in this State to maintain cleanliness and to stimulate those trusted with quarantine, we should not only prevent the entrance and spread of the disease, but, faced by such an enemy, the legislators would be reminded of the vast importance of a good code of sanitary laws and vote liberal appropriations for the execution of the same.

The following words of the late Dr. Richardson should be ever kept in mind. "Cleanliness covers the whole field of sanitary labor. Cleanliness, that is purity of air; cleanliness, that is purity of water; cleanliness in and around the house; cleanliness of persons; cleanliness of dress; cleanliness of food and feeding; cleanliness in work; cleanliness in habits of the individual man and woman; cleanliness of life and conversation; purity of life, temperance, all these are in man's power."

"How small of all that human hearts endure,
That part which laws of kings can cause or cure,
Still to ourselves in every place consigned,
Our own felicity—we make or find."

CLINICAL LECTURES.

OVARIAN CYST AND UTERINE FIBROID—OPERATION—CURE.*

M. A. MANN, A.M., M.D.,†

Last week you saw in this clinic a woman with a large abdominal tumor. Her case was of historic interest, for upon her Dr. Julius Miner did his first successful ovariotomy.

Three years ago she consulted me with reference to another abdominal tumor which I advised her to leave untouched unless it began to trouble her. Recently she returned saying that the tumor had enlarged rapidly and last week you saw the examination made to learn her condition. There was a large ventral hernia covered, apparently, only by skin and peritoneum. Under the hernia was a hard tumor and behind that another larger mass which fluctuated. The diagnosis, therefore, was uterine fibroid and ovarian cyst, complicated with a ventral hernia. Six days ago I opened the abdomen and found the diagnosis correct. Immediately on incising the peritoneum, this large nodular fibroid presented. It was adherent to the bladder, which was drawn up and spread out upon the tumor. Both broad ligaments, particularly the left, were drawn up laterally over the tumor. The tumor was also attached to the cyst which lay posteriorly and to the right. The external incision was lengthened and the fibroid pulled out of the abdomen. I then tapped the ovarian cyst and emptied it of its contents, which were clear and of the consistency of diluted white of egg. Drawing out the collapsed cyst, I found it covered with a thin sheet of adhesions; these I tore away until the cyst was nearly free. It was then found to be quite

*Report by A. L. Benedict, M. D.

†Prof. of Gynecology and Obstetrics University of Buffalo; Gynecologist to Buffalo General Hospital.

firmly attached to the side of the uterus. These adhesions were tied with cat-gut and cut. This afforded a better opportunity to work at the fibroid. The opposite broad ligament was tied with very strong cat-gut and cut loose, a clamp holding the uterine end. Then after carefully dissecting the bladder from the fibroid I passed an elastic ligature around the cervix. The cervix, owing to the long continued traction from above, was drawn out to the length of two inches. The body of the uterus, including the fibroid tumor, was cut off above the elastic ligature, leaving a cup-like pedicle consisting of the upper portion of the cervix. Having secured this pedicle with a wire clamp, I next sewed the pedicle below the wire to the peritoneum in the lower part of the abdominal incision, after which I closed the abdominal wound. You remember that Dr. Miner attributed his success to the fact that he did not put any stitches through the peritoneum. I sewed the peritoneum very carefully with cat-gut and wire and I attribute my success to the fact that I did sew the perinoneum. What a change of views in the last few years. Of course, part of the stump must slough away and I made the closure of the peritoneum below it as perfect as possible so as to prevent the absorption of septic matter. The external portion of the stump was completely buried in a mixture of boric acid and iodoform and then the ordinary dressings were applied.

The patient has had some abdominal pain, due to the gas collecting in the intestine as is usual in such cases. She has done exceedingly well thus far, her temperature has never been above 100° and the pulse has ranged between 70° and 80°. Yesterday I took the clamp off, leaving the transfiction needle to hold the pedicle up until it sloughs away. The woman is now practically out of danger and when she gets up she will be free from the annoyance of the old hernia. I will not promise that she will not get another hernia at the seat of the pedicle, but this cannot be helped.

Later report. The patient recovered entirely.

ENDOMETRITIS.

This woman is 46. In her twenty-four years of married life she has had five children, the last fifteen years ago. She was weak after this labor though not more so than after the others, and she has been sickly all her life. Nine years ago she had an attack of terrible pains in the womb. The pain was almost constant but was made worse by passing water and the micturition was frequent and difficult, especially at night. This indicates an irritable condition of the bladder from some cause. She also had backache and pains in the sides, but more in the left than in the right. These aches and pains have continued to the present time. Her heart troubles her so much that she can get up stairs only with great difficulty. She is not able to wash nor to do other hard work simply on account of the fatigue occasioned. Her menstruation is regular, lasting three or four days usually and during two days she flows excessively. Two months ago she says she used fifteen napkins and some of them were simply dripping. Two years ago she had some minor operation performed which improved her condition for a time, but she is now as bad as ever again. She has leucorrhœa following menstruation; the flow is profuse and accompanied with pain.

Here is a history which points both to pelvic and cardiac disease. The series of symptoms forms a gradual progress from a condition of moderately fair to one of marked anæmia and prostration. From her attending physician, I learn that she has dilatation of the heart with mitral and aortic murmurs. From the history we can learn nothing as to the exact state of the patient's pelvic viscera. She loses a great deal of blood but we no not know why, whether from some malignant or benign growth of the uterus or some other condition. The pain of which she complains in the vicinity of the heart is probably due to intercostal neuralgia, which occurs in a large proportion of cases of ovarian disease. In order to ascertain the character of the pelvic lesion, I will make a physical examination. I find that at some one of her labors, perhaps the first, perhaps a later one, she has sustained a broad, almost complete laceration of the perineum. The tissues between the finger in the anus and the one in the vagina are very thin, since the perineal body is almost entirely destroyed. The parts are very sensitive. As the fin-

ger passes farther in, the cervix is found not to be in its normal position. It is higher and farther back than it should be. Like the perineum, it has sustained a laceration and the two lips are widely separated by a bilateral tear. I try next to discover the location of the uterus. The tissues in front are quite soft, proving that the uterine body is not there. Moreover the cervix points directly at the symphysis-pubis, which it could not do with the body of the uterus in its normal position unless the cervix were flexed in an extraordinary degree. By putting the finger behind the cervix, I find the body of the uterus there. The condition is not one of retroflexion nor is it the common one of retroversion with prolapse. The uterus is simply retroverted and it lies high in the pelvis. By sweeping the finger around in the lateral fornices, I try to ascertain if there is any foreign body present such as a tumor, a prolapsed ovary or an inflammatory exudate. There is nothing of the sort present. Pressing on the cervix, I test the mobility of the uterus. It is not quite as freely movable as it would be in its normal position but it is not fixed. You will notice that the use of either speculum or sound has been quite unnecessary. There is one other condition probably present, to judge from the history, but this could not be diagnosed without the use of an instrument, which it would not be proper to employ since the patient is going home immediately after the clinic. If I were to pass a curette into the uterus and gently scrape its wall, I should probably bring away a few granulations, and the removal would be followed by a slight discharge of blood. It is to a granular endometritis that I attribute the excessive menstrual flow, of which this patient complains. The uterus, also, is enlarged and, from the long-continued displacement and laceration, there has resulted a congestion which in course of time has caused the granular endometritis. There is also an endocervicitis, which accounts for the leucorrhœa occurring after each menstrual flow.

The woman has quite cause enough for her complaints of ill health. Is there any relation between the cardiac and the pelvic lesions? An organic heart disease of the severity of this one, prevents the blood from circulating freely and tends to back the blood up in the extremities and the pelvis. It is altogether probable, therefore, that the congestion and consequent enlargement of the uterus and endometritis are added to by the cardiac disease. In some cases of heart trouble there is severe menorrhagia as a direct result.

Now comes the question which is important for the woman. Can we relieve her? She can not, of course, be made entirely well, since the heart lesions are incurable. But we can improve her condition greatly by removing the abnormal pelvic condition. The ruptured perineum must be restored, the lacerated cervix must be served up, the uterus must be restored to its place and held there. The granular endometritis which probably exists must be treated by the curette. The mere scraping of the womb is not enough unless the other conditions are cured. I believe, also, that it is necessary to make intra-uterine applications in order to cure the endometritis, having learned by experience that the curette is not sufficient. The heart lesion, while incurable, is not so unfavorable as many suppose. I see no reason why this woman cannot be restored to a moderate degree of health by treating her pelvic lesions and I do not think that the existence of the heart disease is a sufficient excuse for declining to give her a chance for whatever relief gynecology can afford.

The treatment of the endometrium can not be properly carried out by the ordinary cotton wrapped applicator. Such an applicator is useful enough in the treatment of cervical endometritis and it is not often that we have to go further than the depth of the cervical canal. Here, however, we must use an applicator syringe which resembles a hypodermic syringe with a very long metal or hard rubber nozzle, no larger than a uterine sound and provided with many small lateral openings. The barrel of the syringe holds about two cubic centimeters. The nozzle is wrapped evenly with cotton, dipped into an iodine solution and passed into the uterus. Most of the medicament is squeezed out of the cotton as the applicator passes through the internal os, but we can flood the cotton again by pressing on the piston. We do not really inject the fluid into the uterus, there is only enough of it to saturate the cotton. This is not routine treatment, it is only required in bad cases of menorrhagia due to corporeal

endometritis and after the uterus has been curetted. I presume I see two or three cases a year which need this treatment; but when they do occur, it is the only treatment which will yield satisfactory results. A great deal of disappointment would be saved both patients and physicians if it were more generally understood that curetting the uterus is not sufficient to cure a granular endometritis. Last winter I saw a case which had been curetted three or four times without benefit. I repeated the curetting, used the applicator syringe and the patient has remained perfectly well. In the treatment of these cases, I have found of late that the plan advocated by Dr. Polk gives very good results. He advises, after forcible dilatation of the uterus and curetting, that the uterus should be thoroughly packed with gauze, the object being to drain the uterus. He recommended the use of sublimated gauze, but, in my experience, this does not remain fresh for any length of time after its introduction into the uterine cavity. I have therefore substituted iodoform gauze, and with it have had better results. A practical advantage of this treatment is that after the first operation, the uterine canal remains for some time sufficiently patulous for the introduction of a narrow piece of gauze by means of an ordinary applicator. The gauze can, therefore, be renewed at the office. Some pain is caused at first but it soon subsides and the beneficial results of this method of treatment I have found to be very great. Although the after-treatment can be carried on at the office, I usually prefer to go to the house of the patient in order to allow her to rest in bed the remainder of the day or longer as may be indicated by the amount of pain. Before Dr. Polk published his method of treating these cases of endometritis, I had long sought a way of introducing iodoform into the uterus and I tried all sorts of plans, feeling sure that the treatment of the uterus on this line would cure many cases which resisted the older methods of treatment. I was glad, therefore, to learn of Dr. Polk's success.

The other conditions existing in this case, the lacerated cervix and the ruptured peritoneum must also be treated. The thorough treatment of the endometritis might result finally in a relapse if these other elements were ignored.

COMMUNICATIONS.

METHODS AND MATERIAL IN ABDOMINAL AND PELVIC SURGERY.

JOSEPH PRICE, M. D., PHILADELPHIA.

I realize how very fertile my theme is for discussion, and my familiarity with current medical and surgical opinion, the lessons of surgical experience and those derived from more or less intimate professional relationship with Fellows of the profession—all forewarn me that some of my opinions or conclusions may be called in question. The openings are many and wide for difference of opinion on many of the questions of our science and art. Ours is a great universe in which we are all pupils, gaining with a humiliating tardiness the lessons of our science. There is nothing we should welcome so heartily as that enlightened criticism which directs the way in correcting our errors. We are not so tied to our present ways of doing things that we will not welcome other and better ones. The responsibilities of uro profession are too grave, our work, when wisely and skillfully done, too beneficent in its character for us to go on repeating errors. We are entitled to the lessons of each other's successes and failures, of repeated or new experiences, the facts evolved of research or experiment. There is no time when we are so happy in being at home as when our critics call—presumably they always have something for us. Fortunately these meetings of doctors cannot be designated as mutual love associations, where all is intellectual harmony—they are something more than festival occasions; they are an important part of the machinery of our medical and

surgical education. The spirit pervading them is one that animates the profession generally. It is a spirit that puts us to bed late and gets us up early.

Though our science is yet in its infancy, much of it has passed from mere speculation to practical and valuable use, and has multiplied the fields of our inquiry. The seeming spirit of innovation is largely a spirit of progress. New and powerful impulses are carrying forward the profession. Reverence for antiquated methods has lost its force. Our literature is being inspired by a spirit of enthusiastic inquiry and research. The earnest, thoughtful men of the profession are speaking through our conventions and medical journals, shaping and leading medical opinion, giving methods and results; and results of methods always constitute the chief element in any decision respecting their value. In all our work the one supreme concern is the result. By result in operative cases we mean something more than recovery from the operation. There is such a thing as lingering surgical deaths — post-operative sequela more to be dreaded than death.

While we honor the achievements of our pioneers, the men who have given impulse and direction to scientific investigation, and would emulate the purity of their examples and the tireless energy of their endeavors, we must claim many advances made by the bold inventive genius of the working physicians of our own period. We are not permitting our own ways to be numbered by the myths condemned by modern science, old superstitions and exploded theories. We accept only those facts as essential and vital which withstand the severest clinical tests.

The evidence of our advances may be found along the lines of every department of medicine and surgery. The advances in strictly medical science lies in the use of simples; our prescriptions have ceased to be pharmacutical inventories; there is less resort to specifics as curative agencies and more attention given to pure nutritive food, pure and fresh air, rigid, persistent and scrupulous general and personal cleanliness. All successful practitioners of general medicine will agree with Dr. Oliver Wendell Holmes that, "The disgrace of medicine has been that colossal system of self-deception, in obedience to which mines have been emptied of their cankering minerals, the vegetable kingdom robbed of all its noxious growths, the entrails of animals taxed for their impurities, the poison-bags of reptiles drained of their vemon, and all the inconceivable abominations thus obtained thrust down the throats of human beings suffering from some fault of organization, nourishment, or vital stimulation. Much as we have gained, we have not yet thoroughly shaken off the notion that poison is the natural food of disease as wholesome aliment is the support of health."

In every department of surgery the advances have been phenomenal. Experimental research, increased clinical knowledge, a better understanding of anatomical structures and their inter-relation and dependence, combined with our advanced pathological knowledge have combined to make possible brilliant surgical success— have placed surgery upon a scientific basis. Our modern surgical triumphs are not due so much to boldness of operative procedure as to the increased accuracy of our physiological and pathological knowledge, our improved technique, skill, care, scrupulousness and mastery of details. The most of us suffered from the inadequacy and inacuracy of our early pathological teaching. We were left much to learn and much to unlearn.

In gynecology much of the early work was experimental in character. Methods were tried and abandoned—and then again revived as new and original. In these claims to originality of method the author has sometimes been honest in his claim but ignorant of the history of the subject. Claims as to authorship and priority of method make some of our surgeons very unhappy. The truth is that it would be better for suffering women if the daddies of not a few of our surgical methods had been quietly chloroformed into the infinite glories in very early infancy, before they felt the embryo movements of inventive genius. The future will make more inquiry as to the results of our surgery than as to who devised or invented our methods. It is to be hoped that, as we go on clearing up uncertainties, all our present methods will be crowded out by better ones.

We will make brief reference to some of our methods or procedures, their wisdom or unwisdom, as their history im-

presses us, that more with the view and desire of eliciting discussion than with the view of presenting any thing new and original.

First, that of vaginal hysterectomy with diseased appendages. The procedure is a very imperfect one and dangerous in the hands of any one—no matter what their surgical experience and skill. The adhesions, omental and intestinal, commonly found in the removal of all adherent forms of disease, must be dealt with from above. The removal of the uterus is a simple matter, but dealing with complications above requires painstaking surgery to save the patients and to relieve them from primary and secondary complications, which are always serious. Hysterectomy for metritis and for prolapsus are unjustifiable procedures and are bound to bring legitimate work into bad repute.

Accidents in freeing or liberating all adhesions are to be avoided by hugging the tumor or cystoma closely in freeing adhesions. If the cyst or tumor is adherent to large vessels, kidney, ureter or liver, the adhesions are to be followed carefully in lines of cleavage. Large and small bowel adhesions are to be liberated with care, and both sides of the bowel inspected that all links and bands of adhesion may be freed and not permitted to remain sources of danger by constriction favoring acute or chronic obstruction. Hemorrhage is to be guarded against with care; it follows rude enucleation, hasty work, want of surgical knowledge, that which comes only of practical experience in the use of ligatures. Bulky vascular pedicles should be sub-divided, each ligature containing sufficient tissue for safe hæmostasis. The hemorrhage may not be free, but oozing or slight—favoring a large clot; this in a feeble patient not drained will result either in death or tedious convalescence, sometimes in suppuration and pyæmia. Of the numerous methods of dealing with the pedicle, many of which have fortunately been abandoned, that of ligature and cautery remain the most reliable and trustworthy. A retracted pedicle is one of the most unfavorable accidents in ovariotomy. It is to be treated by reopening and retying. If the operator is apprehensive of hemorrhage he should place his finger on the stump before tying the lower sutures. The drainage tube, if placed, will be a hemorrhage sentinel; if not placed he will have to rely upon the patient's pulse and color, counting the patient's pulse often and watching other symptoms so characteristic of hemorrhage. Applications and the administration of remedies will avail nothing. You must seek the retracted pedicle and offending vessels and tie. Peritonitis and Septicæmia are the two common causes of death after abdominal operations. Localized peritonitis is the most common cause of post-operative complications and pain.

In cases of peritonitis, whether due to infection through veins, lymph channels, perforating ulcers, suppurating appendicitis or dermoids, or any of the angry forms of intrapelvic or abdominal disease, the treatment should be prompt, radical and thorough—*seek the cause*—the abdomen once opened there should be no hesitation in removing it, whether it be appendix, dermoid, suppurating tubes or a section of intestine. Having removed the cause, thorough drainage of the unhealthy parts or surfaces will bring the patient around to restored health. In these cases salts performs an important office. Opium should be absolutely avoided—should at no time have a place in the treatment. There is nothing in our surgery so encouraging and comforting as to witness the subsidence of all alarming symptoms immediately upon the early removal of the source of infection—or a tumor ruptured, leaking or strangulated. We often hear men say that a patient is dying from general peritonitis and cannot be saved. This is absolutely an error. The *one saving method* of any variety of general peritonitis is abdominal section and flushing or irrigating with two or more pitchers of clean water—this is the only reliable treatment now known. It has been sufficiently tested in a large number of the most desperate cases, cases actually dying and beyond all hope from any other method of treatment. Opium, poultices and the let-alone treatment are *absolutely worthless* in such cases and never save life. The irrigation and drainage method of treatment saves many. Nothing has made me prouder of my own special work than my triumphs in the treatment of peritonitis.

Some of the operators condemning drainage, irrigation, etc., are in the habit of abandoning a class of complicated cases, claiming that they cannot free the

diseased appendages from the intestinal and other adhesions without risk or danger of fecal fistula. Surely their experience must be limited or they would recognize the great importance of completing these operations at any cost. Operators cannot avoid making holes while freeing fixed and disorganized bowel in the removal of suppurating tubes and ovaries, but they kill their patients by neglecting or overlooking such injuries; they should be repaired promptly and thoroughly and no *mischief will follow.* It should be planted and kept in mind that successful surgery means ceaseless vigilance, rigid, persistent, ceremonious attention to all details; there should be no such thing as indifference to minutiæ. It is the unnoted, neglected things that cause us trouble, that bring calamity to the patient. There should be thorough preparation of the patient for all intraperitoneal operations. About all patients suffering from inflammatory or suppurative forms of pelvic trouble carry loaded bowels, and it is simply surprising how very copious are the evacuations following the use of a saline, and the relief from all pain and the general comfort of the patient is so marked that she generally objects to operative interference. The thorough emptying of the bowels favors comfort and speedy convalescence, minimizes accidents and post-operative complications. Distention rarely follows an operation if the preparation has been complete and the operative toilet a thorough one. I have repeatedly completed one hundred sections without distention occurring in a single case. Drainage by purgation before operation in cases of acute or chronic suppurative forms of disease, and drainage by tube following operation invariably give a cool skin, a clean tongue, slow pulse; make a hopeful, cheerful and comfortable patient, with a total absence of uncontrollable restlessness, despondency, coated tongue, nausea, and all the uncomfortable conditions following the use of opium. In all important or major operations we should have one trained assistant, never many. There should be two trained nurses; they young and healthy, and by habit neat and cleanly of person and trained to military exactness and alertness in all their movements; they should be familiar with the operator's idiocyncracies. In a private hospital more care can be exercised in the choice of a nurse for a particular case than in private practice; for instance in a hospital the choice of a nurse not menstruating can easily be made, where, in the case, the use of at drain tube is probable.

The temperature of the patient is to be looked after before, during and after the operation; damp, cold rooms and corridors are to be avoided; it is important to use warm, dry blankets during and after operation. An operating table made of manifold coils of steam pipe is a simple and perfect way of treating shock. This complex question of shock I will not attempt to discuss here. For the gynecologist one important subject of consideration is anæsthesia. When we consider its importance to refined and successful surgery we must acknowledge that we are by no means giving it the attention it deserves. As a rule anæsthetics are prolonged by necessity in gynecological operations, the operations are much longer than in general operations. The resection of bowel takes more time than that of a joint; the removal of a large fibroid more time than the amputation of a limb. In general surgery the steps of the operation can be anticipated, they are well defined and understood before its commencement; in abdominal section we can in no case see into what any given operation will eventually lead; some are simple, others bristle with difficulties and complications, and in feeble subjects the difficulties and risks are multiplied both for the surgeon and the anæsthetizer. Shock more commonly follows abdominal operations occasioned by exposure and manipulation of abdominal viscera. A number suffer from a variety of shock due to peritonitis following leakage, rupture of twisted pedicle, or the hemorrhage of a ruptured tubal pregnancy. The depressent action of chloroform is so marked and often alarming that many of us hesitate to use it at all, while ether can be given with greater safety, less depression and with a mortality of four per cent. in its favor. It matters not to the gynecologist how chloroform kills. Whether through the heart or some other organ, it certainly does kill quickly and in a way that baffles all preventable effort. Unnecessarily prolonged anæsthesia are to be condemned. Faulty methods of administration in the

hands of men with little or no experience as anæsthetists are also to be condemned. Irritation of kidneys and lungs and nausea can all be largely avoided. Nephritis has never followed the use of ether in my work. All the sequelæ of ether can be kept within bounds of safety if men will only take the care to study the art of its use. The jackknife or rule-of-thumb methods of the young novitiate or house-surgeon are not methods by which the value or relative merits of an anæsthetic are to be tested. Many of the drawbacks with which ether is credited is due to lack of knowledge and skill in its administration.

I would here enter an earnest protest against the rude, often rough handling of patients by physicians. A woman, and she weak, delicate and suffering from disease, sensitive to slightest touch, should not be handled as a Milwaukee brewer would a keg of Western beverage, or a Kentuckean a package of "Fine old Bourbon." It should be understood that she does not need shaking up. For more than ten years I have followed the practice of personally taking the patient from the operating table and placing her in bed. I am satisfied much mischief is done by some of the thoughtless and rude methods of handling patients after operation.

Physicians and nurses would find entertaining and profitable reading in that delightful little book—"Rab and His Friends," written by Dr. John Brown of Edinburgh, Scotland. He invests the illiterate, rude, rough handed cartman with the delicacy, sympathy and thoughtfulness which should govern in our dealing with patients. "Had Solomon, in all his glory, been handing down the Queen of Sheba at his palace gate, he could not have done it more daintily, more tenderly, more like a gentleman, than did James the Howgate Carrier, when he lifted down Ailie his wife."

All operators should have an accurate knowledge of his materials. Only mischief and imperfect work can follow the use of large, coarse silk. Accidents, hemorrhage, abscesses, fistulæ and a variety of post-operative sequelæ follow its use, as they do also the use of bad qualities of cat-gut. Pure, fine silk, well placed is rarely followed by any trouble. Cat-gut is an uncertain and unreliable material as found in the shops. Some of the older operators who carefully select and prepare their own cat-gut have excellent results with few accidents, but they forget while recommending and urging its use that they are placing uncertain material in very many instances in the hands of beginners, some of whom know little about placing a ligature of any character. The law of practice should be with all teachers, both as to method and material to teach the use only of that method and material which in the hands of beginners will do the least harm, is all-around the safest and promises the best results. A number of patients have been lost by hemorrhage alone through the use of cat-gut. In all intra-abdominal work it matters but little what you take out of the abdomen in the shape of abdominal growths, if it is done thoroughly and quickly; but it is of serious concern, matters very much as to what you take in and leave in. The question has been asked why is silk so persistently used. The answer is a very simple one and should be a satisfactory one. The most of our operators have given all kinds of material a fair trial. The results the world over have been the best with silk. Long before the modern *pioneer advocates* of cat-gut championed its use here in America it had been tried thoroughly both in America and Europe and rejected as an unsafe and unreliable material. One of our young American operators says: "silk is a nuisance." He should give it a prolonged trial.

Great care should be exercised in the choice of silk; it should be pure, strong and clean and used in the smallest possible quantity. The range of abdominal and pelvic surgery will never again be confined within their narrow lines, its field restricted to a limited class of cases and to a small number of operations.

Gynecologists are not limiting their study to any one organ. They welcome the advances of the practitioner; recognize that there is nothing met with by the specialist that is not met with by the general practitioner, and that the same sound sense that determines the trouble will suggest the remedy. The reproach from which all surgery has suffered, especially abdominal and pelvic surgery, has been almost entirely due to the blundering work of many who attempted work for which they had no special training.

The fact that the abdomen has been opened many times when it should have been left closed; that there have been many obvious errors in surgery is a weak argument against the surgery of men who haxe devoted time, money and every energy in equipping themselves for their work, who do conscientious, complete thorough and successful work. It is with great pride we can point to some of our own countrymen as standing in the fore ranks of the profession contending with the courage of veterans for its advance. We have in our midst one who has contributed as much as any man living or dead to our advances. I refer to Nicholas Senn, of Milwaukee. With what pride we find distinguished English brothers paying tribute to his work. There is high and deserved tribute in the following from an eminent English Surgeon:

"It is due to Professor Senn, of Milwaukee, that intestinal surgery, from being one of the most fatal departments in surgery, may now be ranked among the most successful, and as time and experience progresses, we may look for most brilliant results, not to be eclipsed even by those of the ovariotomist. Senn's method, which I had the honor of first bringing prominently before the profession in this country (England) proved so successful in the experimental research I made some two years ago, that I have never ceased to impress the importance of his suggestions before the profession." While our country produces such men our profession cannot retrograde.

SOME REPORTS OF THE EPIDEMIC OF CHOLERA OF 1892 IN CITY HOSPITALS OF ALTOONA, PRUSSIA.*

DR. A. HERBST.

The source of infection originated in Hamburg, seventy-five per cent. of this was chiefly carried by the laboring class employed in Hamburg and living in Altoona; the remaining twenty-five per cent. was not so easily accounted for, fifteen per cent., in all probability, having originated in or about the port of Altoona. The suspicion was aroused that the Elbe had been the means of conveying the scourge to both cities, either by the ingestion of the water or by those occupied at the river front, thus coming immediately in contact with the infected water. A few cases will be sufficient to show the possibility of such infection.

Case I. A sailor, enjoying previous good health and of good habits, drank, on the evening of the 23rd, 8 month, a large quantity of water immediately taken from the Elbe, in spite of being prohibited by the authorities on the ship, and on the morning of the 24th he sickened, growing rapidly worse. The afternoon of the same day he was taken to the hospital in the third stage of cholera and a few hours later died. The author cites four more cases quite as typical, the infection being distinctly traced to the ingestion of fresh unboiled Elbe water, and states that he could continue indefinitely, giving proof of the same kind. The typical aspect of grave cholera cases will never be forgotten after once having seen them. The patient who only a few hours previously attended to his duties, lies before you unable to move, the eyes deeply sunken, their lids partially closed, the eyeballs rolled upward, the nasal and cheek bones sharply defined, the skin extremely pale, frequently covered with cyanotic spots of a light or darker blue color, often fading into grayish tints. The integument at times is absolutely dry and at other times covered with a cold, clamy sweat. Its elasticity is gone; folds pinched up, remain stationary. The pulse at time of admission to hospital is often deceptive, the heart's action being somewhat excited during transportation. Some minutes of rest will show the pulse to be almost imperceptible. Others were admitted entirely pulseless; the respirations were slow and superficial; the temperature taken per rectum was frequently subnormal; the extremities

* Abstracted for Medical and Surgical Reporter by Dr. M. B. Werner.

were ice cold to touch; a peculiar indescribable odor surrounded the patient, which may be described as "fœtor cholericus." This odor is also present in the cholera cultures to a lesser degree. If the patient was able to speak, his voice was hoarse, thick, sometimes without sound; this may be termed "vox cholerica." Sometimes before the patient reached the bed the vomiting and diarrhœa began—the oft described rice water discharges peculiar to Asiatic cholera—and almost immediately after the patient was seized with painful cramps in the calves of the legs and muscles of the fingers. Some of our patients complained of great pain under the border of the ribs which radiated in all directions. This was probably due to the dyspnœa and the exertions of continued vomiting. The intense thirst is of the most characteristic symptoms, the patient drinking all that is presented, only to vomit it the next minute. The great loss of water from the system reduces blood pressure and consequently the secretion of urine becomes diminished, so that only a few drops can be voided at a time.

Of importance, according to the experience of the author, are the symptoms referred to of sight and hearing; the conjunctiva and sclera are markedly injected, often amounting to hemorrhage from the subconjunctival vessels; the conjunctiva itself is dry, dull and often presents small ulcerations. The patient complains of burning pain in the eyes. In grave cases, even before death, gangrenous patches are noticed on the sclera and cornea. These spread rapidly after death. The sight was not disturbed except in a few cases, who complained of darkness before the eyes, in two others there was double vision. The symptoms referring to hearing were equally characteristic. A large majority complained of intense tinitus aurium first in the right, then in the left, and then in both ears; others complained of deafness, as though the membrane had been placed over the ear.

The author proposes two explanations for these symptoms:

First—due to thickening of the blood and therefore lessening the circulation; the other due to nervous symptoms arising from the intoxication of the cholera poison.

Regarding the *temperature*; in grave cases the temperature is usually subnormal. This fails to correspond with the cholera epidemic at Hamburg, 1873, where some cases were reported to be without fever, while in others, the temperature rose to 42° Cent. There had also been recorded a difference of between 2° to 3°, if taken in the rectum or the axilla.

The author records in the first 138 cases only 16 in whom the temperature was beyond 37°, taken usually on the same day of admission; 38° was met with in four cases; in all others the temperature was below 37°, quite often as low as 32°, or 31°. In 238 cases there was about 15 per cent. in which the temperature was not over 38°, in 5 cases it reached 39°, but not over 39.6°; of 16 cases the axillary temperature was over 37°, 9 of these recovered; of 35 patients, whose temperature, taken in the rectum, was over 38°, 21 recovered.

Cause of the disease.—The severity of the attack usually lasts some hours, less often days. Its course may be more rapid from the fact of the great loss of water and the subsequent reduction of temperature rather than the intoxication of the poison; heart failure and exhaustion usually proceeding death.

An improvement due at first to the natural resistance and aided by well directed treatment, will often give way to the secondary stages of cholera infection, in which the patient often passes into a comatose state, known as cholera typhoid. The face may be deep red, shining, though the patient may be snoring. When roused the speech is slow, the words scarcely articulate; the lips, tongue and gums are dry, the sordes collecting in the mouth, the head bent back, the eyeballs rolled upward. Examination of the internal organs seldom reveals pathological conditions, only occasionally mucous rales are heard. The heart's action is good, the pulse full, bounding but not dichrotic, the liver and spleen are not enlarged, the temperature at times rapidly increased from sub-normal to 39° or 40.° In most cases, however, it remained below normal. The diarrhoea during this stage ceased entirely in some patients.

The delirious patients frequently allowed their discharges to pass into the bed. Vomiting ceased during this stage. The most unfavorable prognostic sign is the condition of the kidneys.

Recovery was usually of two forms—First, in which it set in immediately after

diarrhœa and vomiting had ceased, the temperature and pulse returning to the normal. In the second group of cases the stage of reaction was ushered in by a rise of temperature, the face reddened and the patient complained of heavy and internal heat. A careful examination of the internal organs gave negative results. The temperature and accompanying symptoms usually lasted from eight to ten days. Among the *complications* are alcoholism and its results, delirium tremens, we have no less than twelve cases or three per cent. of decided delirium tremens; of this number ten died.

Pregnancy was present in five patients, in three abortion took place, and soon after, death. In a fourth the patient died before abortion; the fifth did not abort, and she recovered; the last was in the fifth month, the fourth case was in the fourth month, the first three were in the third month.

The *sequelæ*—Recovery is often accompanied by painful inflammatory swellings of the extremities, which may form abscesses; these have been treated successfully by moist carbolic and boric acid applications. These peculiar infiltrations were noticed in thirty patients, particularly in those who had received numerous subcutaneous camphor or ether injections. As a result of the cholera infection there was noticed an exanthematous rash, much like measles or urticaria, which suddenly disappeared; of the patients on whom this rash was noticed all recovered.

In two cases there was infiltration of the joints, probably aided by articular rheumatism; one patient complained of sleeplessness during convalescence.

The *treatment* consists first in the extirmination of the bacteria; second in eleminating the toxin from the system, and supplying the loss of water. The first indicated were antiseptic liquids given by mouth; the creolin, so highly recommended at first was used twice daily in five gram doses in hot tea, but was found not only to be inefficient but dangerous, since its unpleasant taste usually excites vomiting, or at least a burning in the throat and eructations.

Toxic symptoms were not noticed after the use of this drug; capsules of creasor were also ineffective; salol was also used with negative results; lactic acid and hydrochloric acid were also used without benefit; opium was of little or no use. There remained but two remedies, calomel and tannin. In cases of a milder type in which the pulse was strong, 0.5 of calomel was given two to three times within the first two hours, followed by 0.05 gram every two hours, stopping the remedy at the end of two days.

A one per cent. solution of tannic acid, at a temperature of 38° to 40° as recommended by Cantani, the enteroklysis, per rectum, was used, injecting as much as the bowel could hold, the patient being placed in the knee chest position; this was performed every three hours. It was rejected frequently, but found to contain large quantities of comma baccilli. Some patients complained of the taste of tannin, which, however, was favorable, in that it showed the injection had passed the ileo cæcal valve. 202 patients were treated with these injections, 100 of these recovered. It is important to remember that a number of those died who had been brought in the last stages of the disease and had received one or two injections ante mortem, but had been beyond human reach on admission; calomel and tannin used at once, gives the best results, forty having been treated in this manner with twenty-eight recoveries. The cholera poison paralyzes the nerve centres, particularly those of heat production and the vaso motor system. The loss of water produces a thickening of the blood, interferes with the circulation and oxygenation, hence the necessity for a rapid action upon the circulation, which in turn will thin the blood. This can be done by the intra-venous and subcutaneous infusion of liquids.

The former was performed by Prof. Rumpf, of Hamburg, who stated that the hyperdermic use of salt solution gave less desirable results than the intravenous injections.

The author, however, does not coincide with Prof. Kumpf, since, on the whole, twenty patients having been treated with intra-venous injections using the vena mediana, the method was unsuccessful, all the patients having died. One patient in particular having received five injections at different times; the immediate result after each injection being very encouaging, this lasted, however, only fifteen

minutes, and the collapse became greater than before, until at last death ended the scene. Another case brought in pulseless received a subcutaneous injection of 600 cubic centimetres of the physiological saline solution into the thigh. A few hours later there seemed to have been but little absorption of the fluid and the pulse scarcely perceptible; 800 centimetres were injected into the vein, the pulse remaining the same, the condition of the patient hopeless. On the evening of the same day 1000 cubic centimetres were injected into the abdominal walls, in the morning the fluid had all been absorbed, the pulse could be easily felt; the camphor injections were then given every ten minutes, this aided materially towards improvement. The patient was able to speak, her condition being markedly improved. The author never noticed any thing more than a slight redness over the seat of injection; the infiltration caused usually subsided in a few days. About 350 such subcutaneous infusions were administered to 215 patients, of whom 66 recovered.

Under the head of symptomatic indications the author mentions woolen blankets, warm bottles, hot cloths, rubbing the extremities, etc., as means to raise the temperature; internally the administration of hot wine, coffee or tea; the subcutaneous injections of camphor, if necessary, as often as every 10 minutes; sulphuric ether frequently produces abscesses and, being generally painful, was not used.

Hot baths, temperature from 28° to 35°, more often failed, collapse setting in instead of the excitation and warmth mentioned by others. The cramps in the muscles were treated by hypodermic injections of morphia, often in large doses, bearing in mind the possible paralyzing action upon the heart; vomiting frequently ceased after the injection. The nourishment, as long as the diarrhœa kept up, consisted chiefly in oatmeal gruel, to which was added some red wine. The author was as helpless in treating the uræmic symptoms as others had been.—*Mŭch. Med. Wochen.* No. 3 and 4, 1893.

A CASE OF PNEUMONIA WITH REMARKS.

E. J. KEMPF, M. D., Jasper, Md.

I am five feet ten inches in height, 150 lbs in weight; am a dark blonde and have gray eyes; am thirty-five years old; a physician. I am of a nervous temperament. I am subject to urticaria, sick-headache, neuralgic pains in the shoulder-blades, and to bilious attacks. I am used to an outdoor life. I do not smoke or chew tobacco. I have always been a moderate drinker, never an abstainer. I am inclined to worry.

For several weeks in December, 1891, I had been complaining of a simple bronchitis accompanied by symptoms of an indefinite nature, such as a feeling of general malaise, biliousness, constipation, headache, lose of appetite, and nasal catarrh.

On my way home from a professional call into the country I had a chill, and I felt as if my left lung was not all right. I could not use it freely. I stopped at a country saloon and got me a whiskey with which I took ten grains of quinine. This quickly took effect and I felt better.

That night, December 22, I did not sleep a wink, and I sweat until the bedding was soaked with perspiration. The next morning my temperature was 99°F. I dried myself, dressed, got up, and attended a patient in my office. I then went to the well and drank a pint of cool water. I noticed that the water was unusually cool and nice. I also noticed that the things on the breakfast table looked absolutely sickening, so much so that I had to go out of the room. I now came to the conclusion that I was really sick. The sputum was rusty, and my side felt as if it had a board in it. During the day I took ten grains of blue mass, ten grains of quinine, and five grains of hyoscyamus extract. I urinated with difficulty, and urine being as red as sassafras-tea. During the night I sweat profusely as I lay awake counting the ticking of the clock, and wondering when the morning would come.

In the morning I got up. No sooner was I in the erect posture, than I was attacked with a severe stitch in the side. No pen can describe the severity of that pain. I gasped for breath, and I held my side, until the pain let up a little. Then I sat on the floor, mainly because I knew that if I sat on the floor I could not fall. I told my wife, that, at last, I had to give up, and that she would have to send for some one else to help her in her trouble; she was in labor.

Up to this time I had fought back the sickness, but it had finally overpowered me. By-and-by Dr. J. A. Salb came and attended my wife. He inquired about me, and after making an examination of my chest and of the sputum, he said, "yes, you have pneumonia." That night I took ten grains of quinine and ten grains of Dover powder, and sweated and counted the ticking of the clock as on the previous nights.

In the morning I could not urinate, and I tried to pass a catheter myself but failed because the urethra was very sensitive. Dr. Salb called on me, and found, so he said, my pulse good, temperature 104°, tongue coated and full of small herpetic blisters which were quite painful. He catheterized me, gave me a hypodermic injection of morphine and atrophine for the pain in my side, and directed the nurse to give me a saline cathartic. During the day I took five grains of quinine and ten grains of antipyrine alternately every three hours. Toward noon the saline caused me some griping, and I ordered my nurse to mix four ounces of glycerine, four ounces of epsom salts and a pint of warm water, which I injected in my rectum with the most ultra effects. For the next half hour I became a raving maniac. After it was all over I fell into the bed completely exhausted. Nevertheless, the severe purging I had undergone seemed to make me feel very much better. The catheter had to be used twice a day, morphine and atropine were injected into my side about every six hours to ease the pain. A blister was put to my chest, followed by the application of dry poultices. Dry cups were applied to my back.

The nurse, Mrs. Gutgsell, was to my aching eyes and weary limbs kindness itself. For the next two weeks she and I did not part company.

For fourteen days and nights I could not sleep, that is as far as I know. During this time I lived over my whole life-infancy, childhood, youth, school days, and college days. I was back again in past experiences. Time was no object and I was soon in the present. I travelled over the United States from end to end; over the Pacific Ocean landing in Asia; through India, over Asia into Africa; through the wilds of Africa shooting lions and elephants and stealing negroes whom I sold to the Turks; next into Palestine and then throughout Europe back again to America. The ordinary modes of travel were no longer good enough. The doctor put me and my nurse into a pneumatic tube and away we flew. In this way we visited not only every country, but also every city and hamlet on the globe. This too no longer suited my very active mind, and I now hired me a star. On top of it, my nurse and I flew through the universe. Millions of miles were passed in a flash, uncountable worlds were visited, unspeakable scenes and nondescribable scenery were looked upon, and untold millions of people on never-ending streets were met. The mountains were miles high, the valleys immense, filled with beautiful cities. Just imagine a street a million miles long with a row of houses on each side, of all sizes and shapes, all built of marble, granite, silver, and gold, lighted with electricity, and embellished in every fantastic way.

And then with a start that made the bed crack I was back in the room. The pictures on the wall glared at me, the wall-paper was a mass of living, moving creatures. Little Brownies were everywhere. They crawled into the medicine-bottles and crawled out again, making grimaces at me. If I shut my eyes a perpetual panorama passed before me, if I opened them everything took shape and action. I felt as if my room was in some cave, as if the earth were in some unaccountable way pressing down upon the room. I knew every body, understood every word or whisper of the nurse or the doctor or the visitor, and heard every noise in the house.

I often think over these things I here narrate, and on no condition would I efface these, to me, actual experiences from my memory.

As soon as the crisis came and resolution commenced I felt some relief. I

could now sleep a few hours at a time by taking fifteen grain doses of chloral hydrate. A sa tonic I took syrupiodide of iron and syrup of the hypophosphites, and also tincture of nux vomica and the compound tincture of gentian. I also had my chest painted once a day with tincture of iodine, and must say this felt grateful. I took malted milk in hot coffee, and a glass of hot milk occasionally.

It was several months before I could resume my practice.

Remarks. During a practice of fifteen years in this country, I have met with many cases of pneumonia, at all seasons of the year. The bulk of the cases occur during the winter and spring months. Cases occur in groups, that is, if a doctor got a case of pneumonia, others generally followed. Cases occur after a north-east wind, especially if accompanied by a few rainy days. Cases occur in people who expose themselves to inclement weather, whilst suffering from some temporary indisposition.

Cases occur in families. My father and my grandfather died of the disease, I had it once, three of my boys have had it. In my experience as a life-insurance examiner, I found that where one of the parents, or grandparents had died of pneumonia, another had died of puerperal fever, or erysipelas, or meningitis, or chronic bronchitis, or typhoid fever, showing a predisposition to these diseases. Frequently have I treated erysipelas in people just convalescing from pneumonia, and more rarely has pneumonia been a sequel to erysipelas. Statistics show that puerperal fevers occur more frequently in the months of February and March, during the time that pneumonias are prevalent in the land.

If you have a patient suffering from chills and fever, or ague, or malaria, more than likely he will have pneumonia later on. If you know of a person suffering financial reverses, or burdened with some sorrow or trouble, watch for pneumonia as one of the diseases most likely to occur.

Persons, who in infancy have infantile eczema, who later on suffer from urticaria, boils, herpes, headache, vague pains, rheumatism, erysipelas, lumbago, sciatica, bilious attacks, indigestion, neurasthenia, or "the blues," all are liable to pneumonia, and they are generally bad cases.

Pneumonia never occurs in a healthy person. The disease is preceded by a period of ill-health. The patient is constipated, because the liver, stomach, and intestines are inactive. The kidneys are overcharged with work and become clogged. The urine becomes high-colored and full of uric acid. The blood is changed and is filled with battling pneumococci and white corpuscles. The brain suffers and so also the nervous system. I sometimes have thought that future medicine will class pneumonia as one of the neuroses.

Nevertheless, pneumonia is a specific fever, self-limited, but not to be cut short. It occurs in persons predisposed to the disease. The disease itself seems to be a crisis which the system undergoes, and the system acquires an impunity to the disease for a longer or a shorter time. But those who have the disease once can make up their minds for another attack. Not because an attack predisposes the system to another attack, but because the condition of the system makes it a fertile soil for the pneumococci.

Though pneumonia cannot be cut short, it can be prevented. How? Let those predisposed to the disease, regulate their mode of life, regulate their diet, abstain from alcoholic liquor and tobacco, wear flannel next to their skin, avoid the taking of colds; above all, throw care and worry to the dogs.

Remember that, in uncomplicated pneumonia, the heart is not diseased. It is the blood and the nervous system that is out of fix. And all the organs, excretory as well as the lung and heart, are suffering.

The question is whether the liver and the kidneys are often not as badly clogged as the lungs. Have you seen cases of pneumonia complicated with swellings of the parotid and other glands? Such cases were to my mind like those of metastasis in mumps. In such cases the kidneys act very poorly, and the disease generally ends fatally.

As to *treatment*, it is well to commence a case of pneumonia with small doses of calomel or blue mass, afterwards to be followed by an occasional saline. Quinine can then be given because it seems to do good in all cases, especially where there has been malaria in the case. Opium is useful as an anodyne, and it seems to limit the amount of hepatization in the

lungs if it is cautiously used. Morphine and atropine hypodermically used is a specific for the stitch in the side, whether due to a pleurodynia or a local pleuritis. Whether digitalis does any good in pneumonia I am not prepared to say, but I think we have other remedies that will do more good if the heart needs stimulating. Alcohol, and carbonate of ammonia, nitroglycerine, strychnia, cactus, all are safer and more reliable. In cases of irregular heart with inaction of the kidneys, digitalis may do good and should be tried. In the earlier stages, where the fever is high, antipyrine or aconite cautiously used may be of service, but I am fully convinced that baths, either the sponge-bath or the wet-pack, should be preferred. In the later stages, muriate of ammonia and iodide of potash with the bitter tonics and the iron preparations and good food, all may aid in hastening the recovery of the patient.

But remember we have no specifics for pneumonia. Each case must be treated by itself. Treat the symptoms and trust to good nursing. As to feeding, I am fully convinced that pneumonia is not one of the fevers that should be fed. The intense disgust for any and all food, which accompanies the earlier stages of the disease, and which must be experienced to be fully appreciated, should be respected. A little water given often, and a little milk, and alcohol if needed, is all the food that I give my patients in the first two stages of pneumonia. During the later stages and when the appetite returns, give your patient easily digested food. Malted milk is one of the best I am acquainted with.

Locally, I use mustard plasters or blisters in adults in the commencement and poultices later on. In children I direct the local application of turpentine liniment and cotton-pads. To aid resolution I often apply tincture iodine or dry cups to the chest.

I pay particular attention to having the room well ventilated, always at a temperature between 65° and 70°F., and to have some steam in the room to keep the air from being too dry. I keep the room quiet, and insist upon constant attendance by a nurse.

In conclusion I would remind the reader that this is not a treatise on pneumonia, for such I refer you to the text-books, but it is a plain expression of some simple ideas and experiences of mine with this interesting and important malady.

SOCIETY REPORTS.

THE MEDICO-CHIRURGICAL SOCIETY OF LOUISVILLE.

Stated Meeting, April 7th, 1893.

The President, Dr. F. C. Simpson, in the Chair.

UTERINE POLYP.

Dr. W. O. Roberts: Day before yesterday a lady sent her husband to my office to ask me to send her a pessary to hold up her uterus which was out of place. The woman is fifty-two years of age, very large and fleshy, and never had any children. I told the husband that I could not do anything without first examining the case thoroughly. He sent for me to-day. I found protruding about a half inch from the vulva, a polyp that seemed about as large as my thumb. The dedicle extended up into the neck of the uterus. I removed the growth after ligating the pedicle, and present the specimen for your examination. The patient thought it was her womb.

It calls to my mind a case which I had some time ago. A young woman who had been a widow for several years, consulted me and said that she had not had her period for a little over six weeks; shortly after that I was sent for and found her flooding. By digital examination I found what I took to be the membranes protruding. I grasped the mass firmly

with my fingers and tried to pull it out but it would not come. I inserted a tampon to stop the hemorrage and the next day I found the substance protruding still further. I made a more careful examination and discovered that, instead of a miscarriage, it was a polyp trying to get out of the uterus. The woman was having regular labor pains and at first I felt satisfied that it was a miscarriage.

ENLARGEMENT OF CERVIX DURING PREGNANCY.

Dr. J. G. Cecil: Dr. Robert's remarks recall to mind a case that I saw last year at the University clinic; while it was not a polyp, it was one of those peculiar freaks of nature which we sometimes meet and which, for a while, keeps us guessing as to what it is. It was an enormous enlargement of the cervix with the woman pregnant five months. The cervix was so enormously elongated and enlarged that it had prolapsed until there was a tumor fully as large as a man's fist resting outside the vulva. At first I thought it was a sub-mucous fibroid which had been extruded by contraction of the uterus and was being retained by the pedicle. An examination of the part that was resting on the vulva revealed a hole in the lower part of it which would easily admit the full length of the finger. I introduced a sound into this opening very carefully, not suspecting at the time that the woman was pregnant, when to my surprise the sound entered seven or eight inches. The tumor was very much ulcerated, discharging a foul pus. She was walking about with this prolapsed cervix outside. I replaced it by putting her in the knee-chest position, greasing the tumor with vaseline and then making pressure upon it reducing it in size until it slipped back. I then applied a tampon and sent her to the hospital. Up to this time I had not made up my mind fully as to the nature of this tumor, because I could easily discover a tumor above which had especially the appearance of the womb, and I could also ascertain a direct connection between this tumor which was outside the vulva and the womb, for I could probe it to the depth of seven or eight inches; I was somewhat puzzled as to what it could be. After it was retained in position for a while and had reduced very much in size, an abortion came on which demonstrated the facts that the woman had been pregnant for five or six months; that the child had been dead for probably a week or more, being much macerated and decomposed. It was a peculiar case and one that might easily be mistaken for almost anything, but under conservative treatment, watching it and waiting for developments as to what it could be, the case turned out very well for all parties concerned. It is simply one of those oddities which we occasionally meet in shape of tumors coming from the vagina, resting in the vagina or being directly connected with it

TUBERCULOUS KNEE JOINT—AMPUTATION.

Dr. W. L. Rodman: This specimen was taken from a young man twenty-seven years of age, who gave the history of tuberculous disease of the knee joint for the past eighteen or twenty years. Examining the limb very carefully, I noticed that there was at least two to two and one-half inches shortening of the leg and altogether it looked a very unfavorable case for resection. I sent him to the Norton Infirmary with the full understanding on his part that a resection would be done, but if the bone was found to be involved to any great extent we would amputate his leg at about the lower third of the thigh. An incision was made and the joint resected. As we expected we found a large abscess cavity in the inner condyle of the tibia; also one in the inner condyle of the femur. These abscess cavities extended deeply into the bones; the one in the inner depression of the tibia extended down to the medullary canal, communicating with it; the one in the femur extending up at least $1\frac{1}{2}$ inches. We decided that it would be jeopardizing the patient's life to an unwarranted extent to attempt resection and, even if we succeeded in saving his life, we could not give him a useful limb, so the member was removed just above the knee. I present the specimen to show the abscess cavities in the lower end of the femur and upper end of the tibia.

Resections of the knee joint do not do any too well at the best, and I think anything else but amputation in this case was out of question. There were a number of fistulous openings, two or three of which were discharging at the time. The patient has done very well since the operation, eight days ago.

DISCUSSION.

Dr. C. Skinner: I saw the case with Dr. Rodman before the operation, and had the pleasure of seeing the operation performed. There were two or three features in the case that to my mind opposed resection. In the first place the poor limb that you get at that age, and the risk you run in any resection; further the extreme shortness of the tibia made it unreasonable to suppose a good limb would be obtained by resection. Although the man was twenty-seven years of age he had a tibia of about nine or ten years; there was at least two and one-half to three inches shortening of the limb existing which would have made the shortening at least four inches after resection. Artificial limbs are so well made now that I think they are of more service than limbs so short as this one would have been after resection. We were surprised at the depth of the abscess cavities in the bone at the time of the operation, but were not at all surprised to find the accumulation of pus.

Dr. W. O. Roberts: I operated on a case something similar to this a few days before Dr. Rodman operated. The patient was a girl in this city who had suppurative disease of the joints since childhood. The tibia in her case was nearly four inches shorter than that of the sound side, still she had been able to be around with the aid of two canes. I simply did an amputation without making any attempt to resect. In the case operated upon by Dr. Rodman I do not see any other course that could have been pursued. I do not think it is necessary to attempt in these cases to save the limb, especially where the bone has become involved to the extent that this specimen shows. As a rule resections do not do any good where it is necessary to take off much bone. In young subjects, of course, we are wery careful not to do resections where there is disease of the bone itself, because if we take off much bone the limb ceases to grow. Although this man had probably gotten his growth, owing to the extent of the bone involvment there was really no other course to pursue except amputation.

I operated at the Norton Infirmary last fall upon a man sixty years of age, who had an osteo-myelitis; after twice sawing off the bone I still found the medullary canal diseased, and with a spoon I scraped it out clear up to the upper end of the bone, then introduced a drainage tube. He got along beautifully and now has a stump on which he can use an artificia limb.

CHOLECYSTOTOMY.

Dr. A. M. Vance: Nine days ago I was called to see a woman fifty-seven years of age, with the statement that Dr. Dugan had been called the day before and had told her that she had appendicitis. I made a careful examination of the woman and came to the same conclusion. There was quite a tumor in the region of the appendix, extending well down into the pelvis, very sensitive, particularly at a point midway between the anterior superior process of the ilium and the umbilicus. She gave the history of having had a similar attack about a month before. I advised her to go the Norton Infirmary at once and have an operation performed. I made an incision in the region of the appendix and came immediately upon a tumor that looked something like the kidney, but as I had gone through only one layer of peritoneum I knew it could not well be the kidney. Upon further investigation I came to the conclusion that it was the gall bladder. I aspirated, removing quite a quantity of mucopurulent material (flaky) possibly with some pus in it. I opened the gall bladder, after packing around thoroughly with gauze to prevent the cavity being entered by any of this material, and removed five gall stones at once, and pressing my finger high up in the enlarged bladder I dislodged, with considerable difficulty, this very large stone which was fastened in the cystic duct. The gall bladder was carefully stitched to the abdominal wall, cavity of gall bladder being packed with gauze. The woman made a good recovery.

I will add that there was very little discharge for the first three days. Then there was free discharge of bile, entirely relieving the pain which she complained of in the region of the liver. This case proves how many things may occur in the abdomen, and how parts can be shifted from one locality to another. I remember Dr. Dugan operated upon a similar case some time ago at the Norton Infirmary, removing an enormous quantity of gall stones.

DISCUSSION.

Dr. W. O. Roberts: Were you able to examine the liver?

Dr. A. M. Vance: Yes. The liver seemed to be in a perfectly healthy condition.

MICROCEPHALUS—OPERATION.

I would like to mention another case I operated upon yesterday for Dr. Barbour. The patient was a microcephalic child, two years of age, which I first saw when it was a little less than six months old. Osification of the skull seemed to be perfect then and the child seemed to be very peculiar, having each day a number of epileptic seizures or spasms. I gave it as my opinion then that the child would probably be an imbecile. It has gone on for two years maintaining its physical condition completely but showing no signs of intelligence whatever. I took it to be a typical case for craniectomy, and the parents were very anxious to have the operation done. They investigated the case thoroughly, having been to Chicago and other points for the purpose of discussing the question with other surgeons. Yesterday I made a section of the skull. The child bore the operation wonderfully well. The operation was done very quickly, being finished and dressed in twenty minutes. I present here the bone removed and several instruments which have been devised by different surgeons for doing this work. I first made an incision in the scalp, then with a trephine took out a small button from the frontal bone just above the sinus, afterward making a section to the occiput with the bone forceps which I present here with the specimens. Hemorrhage was very slight. The child is in good condition to-night. It had some little reaction yesterday, temperature going up to 103° F. shortly afterward quieting down to 100° F. There now seems to be much less evidence of nervous irritability, and the muscular movements which were invariably present are greatly improved. The mother thinks there is quite a good deal of difference in its manner, etc., but I do not know whether she imagines this or not. It is the second time I have done the operation, the first being a child nine years of age, a typical case of microcephalus. That child died seven hours after operation.

DISCUSSION.

Dr. Wm. Cheatham: The patient referred to Dr. Vance was brought to me some time ago for examination of the eyes. The child was very restless and fretful, having spasm etc., and it was very difficult to make diagnosis. However I discovered that there was atrophy of both optic nerves.

Dr. A. M. Vance: The eye symptoms have disappeared since the operation. I saw the child two days before the operation was performed and there was no evidence of intelligence; I passed bright objects like my watch before its eyes, but no attention was paid to it. Since the operation the eyes will follow my watch when passed before them and are perfectly steady. Certainly some change has taken place but what the final outcome will be it is hard to say.

Dr. W. L. Rodman: I think Dr. Vance acted very wisely in operating upon one side only in this case, that is, at one sitting. I heard Dr. Keen express himself very freely upon this subject about a year ago. I saw him do one operation of the kind upon a patient six or seven years old. He referred to the operation as done by Dr. Wyeth, which is to operate on both sides at one sitting, when the fingers are inserted in each opening and the bones spread apart forcibly. Keen thinks there is too great an amount of shock when both sides are operated upon at once—he has never done the double operation. The case I saw him operate upon in the Jefferson Hospital a year ago, never had a bad symptom, leaving the hospital in about a week. He, however, expressed very little confidence that the operation would do any good. It was not a very promising case for operation.

FISTULA IN ANO; OPERATION.

Dr. A. M. Cartledge: I present this patient to show one feature that is a little remarkable. It is the most extensive fistula-in-ano that I have ever known to get entirely well after one operation. There must have been in all 28 inches of fistulous tract dissected out. The patient is about 55 years of age and says that he first began to have trouble with the rectum about nineteen years ago. The operation performed about a year ago. You will notice one fistula extended across the perineum to the scrotum and several in

other directions; only one went into the bowel. There was evidences of lung infiltration and he was placed upon hypophosphites and cod liver oil and now seems to be in very good health. He was under treatment about three months.

ENURESIS DIURNA.

F. C. SIMPSON, M. D: I bring before the society to night "Enuresis Diurna," a disease that gives us a great deal of trouble to treat with satisfaction. I have, in the past four years, come in contact with quite a number of cases of day wetting, and one or two I have failed to treat with as much satisfaction as I should like. I have tried any number of drugs and failed to get relief for the poor, unfortunate little fellows. You have one of the most frequent causes in a tight prepuce, which keeps the gland bathed in smegma, which macerates the gland and sets up an irritation that results in incontinence. Yet when you stretch the prepuce or circumcise, you find them going along, having the same trouble as before the operation was performed. We have certain nervous elements that seem to play a very important factor in the little fellow's trouble, but when you relieve the nervous trouble the child continues to wet his clothes as before. You have the distressed mother appealing to you to do something that will relieve her afflicted child of such an obnoxious habit, and you take a list of drugs and prescribe them in rotation, to find that you have failed to do what you have promised the mother you were going to.

I do not suppose there is a member of this society that has not had just such experience as I have related, and finally given to the mother the cold comfort of saying the child would out-grow it as maturity was approached. Can we afford to allow the child to wait so long with such a disgusting habit? I say not. I can only say that the child that is not relieved by the ordinary drugs has a cause for his incontinence that is worse than the incontinence, and that is masturbation. And you will find when you treat them for masturbation they are relieved and get well. You must keep a close watch on them, for they are sly and will repeat the act as soon as the blisters heal. You must have complete control over your patient or you do him no good. If you make close inquiry of the mother, you will find that she frequently catches the child rubbing the parts, this results in an erection and immediately the little fellow has made water. He is unconscious of the desire until he finds that his water is trickling down his leg and his clothes are wet. You find that the majority of these patients play with the parts. The question of masturbation is becoming quite a serious one for the physician to cope with, and experience brings this question up quite often during the year.

You may have muscular debility of the neck of the bladder, or the internal sphincter is sometimes a part of the muscular incompetency which is found among different classes of children. Dr. Jacobi speaks of masturbation as not an uncommon cause of incontinence of urine. In his paper on masturbation in childhood he has directed the attention of the profession to the frequency of the habit with all its consequences. In the young, the *caput gallingi nitis* is quite large, also Cowper's glands and the vesical prostate are sufficiently developed to result in erections. The constant irritation of the parts by self-abuse leads to a chronic inflammation of the whole prostatic portion of the urethra and the neck of the bladder, which is very sensitive.

My experience with these cases is that I find this condition to occur in children from five to eight years of age. I speak only of that class that are free from the trouble at night and suffer during their waking hours. I have found tight prepuces in two cases. They were circumcised with relief as long as the wound did not heal, but so soon as the parts were well they returned to their old habits. In both cases I blistered along the dorsum of the penis and down on the perineum. I found that as long as I kept the blister from healing they did not suffer from the incontinence. It was some time before they had any return, but when they began their old habits of playing with the parts, the incontinence returned with the same regularity as before the blistering. I had to repeat the blisters on one, three, and the other four times, before I controlled the habit and it is now four months since either one has suffered from any trouble of that character. I do not question in either of these cases that the cause of the incontinence was masturbation. I base my belief upon the fact that the mother of both

these boys would catch them playing with the parts and almost immediately following they would wet their clothes; and one mother told me that she found the little fellow frequently with an erection when she caught him playing with the parts. You find that these children are exceedingly nervous little fellows. They have loss of appetite, seem to be debilitated and show some mental hebetude.

In regard to treatment, I will say that I have gone all through the list of drugs and find in these intractable cases that you cannot do anything for them except frequent blistering, which must be persisted in until you give them relief. I have yet the first case to see it fail in and I have seen circumcision, atropia, rhus aromaticus and all the drugs that do good in a great many of these cases, fail signally in giving any relief more than temporary.

DISCUSSION.

Dr. E. R. Palmer: The subject of masturbation in childhood has received a great deal of attention of late years, and very deservedly so, and all physicians who come in contact with such cases should strive if possible to classify them and to relegate the patient to that class to which he distinctly belongs. A masturbator at five years would necessarily fall into the class of "congenital onanism." A child who is instructed by playfellows in onanism, it will be found from examination of authorities on the subject, is rarely so instructed before his eighth year, while it is very common for them to be instructed by their playmates, nurses, etc., any where from eight to thirteen or fourteen years. A child may inherit a pathological condition of the nervous system that tends to produce congenital masturbation and may become a masturbator almost immediately after birth. Classification should be with the view of determining the management of the case. I think those of you who will study the works of Von Kraft, Ebbing on the subject of psychopathia sexualis will be surprised at the remarkable uniformity of cerebral abnormalities in the ancestors of these children. There is, perhaps, nothing that is more hereditable than sexual perversions. You will find in an exceeding large number of the cases collected in Europe, that insanity is a prevailing condition in the immediate antecedents of the children. You will find various forms of cerebral perversions in the way of epilepsy, hysteria, melancholia, etc., etc. One remarkable point or characteristic is the especial fondness for music on the part of the male members of such families.

In the matter of therapeutics, I can well see how a boy that has been taught to masturbate, may be benefited by such local means as described by Dr. Simpson, and perhaps this, in connection with a little moral persuasion, constitutes our chief means of treatment. But in a congenital masturbator, inheriting from one or both sides that condition of the nervous system which in numbers of instances leads to congenital self-abuse, the difficulties of any local treatment may be easily recognized. This class of cases should be treated exclusively by the same line of practice as is employed in pronounced forms of insanity. It is a form of insanity inherited by the child. All those means calculated to increase the physical development of the child and to counteract his unfortunate hereditaments should be the chief concern of the doctor. I do not believe that these cases of congenital onanism can by any possibility be cured by local counter-irritation or by drugs, but the treatment should be directed to the physical and moral nature of the child. It is not simply a matter of daily involuntary discharge of urine to be corrected, but it is to save the child from the sexual perversion and other horrors that follow in the track of the mental obliquity that first manifests itself in congenital masturbation. Certainly this is a matter that should be looked into with the greatest care, not simply because of the primary trouble, the daily involuntary discharge of urine, but because of the graver dangers that threaten the child when he comes to man's estate.

Dr. J. B. Marvin: Dr. Palmer has spoken of only one aspect of the subject and I agree fully with him on that point, but I differ very radically with the essayist in narrowing down these cases of enuresis diurna, nocturna and occasional, to masturbation. A very large proportion of these cases are not due to masturbation. I see a great many cases of this kind, and relief usually follows the ordinary treatment, watching the diet and especially the amount of water they use, etc. I have never resorted to the methods laid down

by the essayist for the treatment of this condition in children. There is no question that the sphincter is very slightly developed in the child, which may explain why they cannot retain the urine. The sphincter becomes more developed after a certain age and the child can then hold his water. I do not think it proper to class these cases under the head of masturbators.

Dr. J. A. Larrabee: Ten years ago I became interested in this subject. I notice that the paper simply included males, therefore I do not suppose the discussion pertains to female children, who are about equally affected by the habit of masturbation, in my experience, but I would like to mention three cases I have recently seen. The children are all female, aged five, six and ten years, and all masturbators. In two of the cases I found the trouble to have been excited by a condition not yet mentioned, that is the presence of ascarides in the rectum. I believe this is possibly a factor in a great number of cases. These two patients were relieved by getting rid of the worms. The irritation produced in the rectum, or the possible presence of ascarides in the vagina, probably directed the attention of the child early to these parts, and the slyness and manner in which the child of six years resorted to the act of masturbation, if it had not been serious, was somewhat amusing. She would steal away by herself, get on a chair and immediately commence a system of wriggling. Her face would become red, the orgasm would be reached and she would drop back exhausted. This was repeated from twenty to thirty times a day.

While I am inclined to believe that many cases of enuresis may be due to the cause spoken of by Dr. Simpson, I agree fully with Dr. Marvin that the vast proportion is due to other causes. I think the nervous element spoken of by Dr. Palmer may have a great deal to do with these cases. The children of nervous parentage are liable to develop not only this condition, but all the train of nervous symptoms. Such children are prone to chorea.

I have never had to resort to the measure of blistering or keeping the parts sore, in the treatment of enuresis. The paper, I suppose, does not include the ordinary bed-wetting. Dr. Watson read a paper before the American Medical Association three or four years ago, including a very large number of children treated for enuresis, incontinence of urine both day and night, and the success of his treatment was so remarkable that I have adopted it. Of course, we all use sedatives to the bladder. We use belladonna, etc., but I do not think we use these remedies exactly as he does. Watson makes a solution (and we know the tolerance of children to the drug) of one grain of sulphate of atropia in one ounce of distilled water, giving as many drops as the child is years old. Probably the average dose would be five to eight drops. This is the point I want to emphasize and impress upon those who use belladonna, viz: that in order to obtain the desired result it is necessary to produce the physiological and even the toxical effects of the drug. I remember the last case I treated was a child sent to me from Peducah, Ky. This child had belladonna delirium following the administration of the drug, and as soon as this was produced, the bed-wetting, which had lasted for four years, ceased and never returned. Watson says very properly that unless the drug is pushed to that extent, a cure will not follow.

Of course in the treatment of enuresis, there are other things which should be taken into consideration. Many cases are due to a condition of the urine, and that should be attended to. In some cases I have resorted to the use of benzoic acid, in others it has been necessary to give turpentine, cantharides, etc. Where a tonic treatment is indicated, I have found nothing better than syr. iodide of iron. I want to record these remedies as having been successful in my practice.

Dr. E. R. Palmer: I believe Prof. Harrison has shown that it is not the sphincter interna but the prostate that controls the urine. It has been shown that the prostate is not a gland but a muscle with gland follicles embedded in it. The sphincter is so weak as to be practically of very little use even in adult life, while the prostate surrounds the neck of the bladder and controls it by contraction. This explains why a boy is eventually able to retain his urine—the development of his prostate which comes in later years.

Dr. F. C. Simpson: In the paper I called attention to what seemed to be incurable cases—patients that have been

treated with every possible care and with every drug that is known to the profession to be beneficial in conditions of this kind and still continue to wet the clothing. There is no evidence of it at night; they go to bed, sleep well and do not wet the bed during the night. I cannot attribute it to anything except the tendency to masturbation. As a proof that the trouble is due to masturbation, I will state that while the parts are kept blistered the urine is retained, but as soon as healing takes place the clothing is again wet.

I do not mean to say that all children who suffer from this condition are masturbators. I stated intractible cases. I could discover no other cause.

Dr. Wm. Cheatham read an article which will appear in next week's REPORTER, on

LEPTOTHRIX MYCOSIS OF THE TONSIL, PHARYNX AND BASE OF TONGUE.

DISCUSSION.

DR. J. M. RAY: These cases of so-called mycosis are comparatively common. When I first commenced treating throat diseases, this form was called "chronic follicular tonsillitis." The fungoid mass springs from the crypts of the tonsils and therefore may often be taken for accumulations of secretions in the crypts; only the microscope will tell positively. In the last few years though, there have been a great many articles written on the subject, and it is now recognized by all throat specialists as due to some fungoid formation. Several cases that I have seen have been of a very aggravated form, in which not only was the tonsil involved, but also the pharynx and base of the tongue. You can take a curette and scrape out these growths, but they will return, no matter what form of medication is applied afterward. The only treatment I find to result in permanent cure is to destroy the follicle from which they spring. This can be very readily done by spraying with cocaine and applying the galvano-cautery.

DR. S. G. DABNEY: I have lately seen several cases of the character under discussion, and would like to make a few points in regard to the symptoms, diagnosis and treatment. I do not agree with Dr. Ray that follicular tonsillitis is the same as leptothrix mycosis. Differentiation between the two diseases is easy. In follicular tonsillitis the exudations are more yellowish in color and very much easier gotten out of the tonsil. In mycosis the growths are shaped like a spear and are very hard to get out. My experience is that in mycosis the patient complains chiefly of a foreign body in the throat. I have found more of the growths on the base of the tongue than on the tonsil proper.

In regard to treatment: Of course the best thing to do is to get out this little mass. Nothing I think is equal to the curette or forceps. I have used electro-cautery, but in the last two cases I have changed to chromic acid with much better result. Attention to general health is often needed. Usually the digestive system is out of order; sometimes we find a rheumatic tendency. The paper quoted by Dr. Cheatham was read by Dr. Knight at the last meeting of the American Laryngological Association. In the discussion which followed, the consensus of opinion was that the disease was best treated by removal of the formation, and the application of the electro-cautery with appropriate means for the general health.

DR. WM. CHEATHAM: There is no doubt in my mind that there is a follicular tonsillitis, as well as a tonsillitis depending upon mycosis leptothrix; and that there are many more cases of the former than of the latter. I have examined seven cases lately with the microscope and found leptothrix threads in but two; one case in which every follicle was filled with white masses, I could not find a thread. Some of these specimens, that of the latter case among them, I had a well-known microscopist examine with the same result as my own. So instead of a majority of such cases depending upon mycosis leptothrix, they are cases of so-called follicular tonsillitis.

DR. H. A. COTTELL: There seems to be some confusion of terms in the names applied to this affection. The term "leptothrix" is commonly applied to the schizomycetes, or microbes, while the term "mycosis" refers to mucoriani, or the moles. These are two distinct natural orders in microscopic cryptogmamic botany. Some of the moles may appear in chains, and might, perhaps, be called leptothrix, but the application of the term to moles, proper, is unusual if not incorrect.

The micro-organism of the disease described by Dr. Cheatham is similar in character to the oidium albicans, which is the parasite of aphthous sore mouth.

THE MEDICAL AND SURGICAL REPORTER

ISSUED EVERY SATURDAY

ADDRESS
Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D.,
Editor.

RODERIC C. PENFIELD,
Publisher.

316-18-20 North Broad Street,
PHILADELPHIA.

TERMS:—Five Dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

REMITTANCES should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

NOTICE TO CONTRIBUTORS:—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, JUNE 10TH, 1893.

EDITORIAL.

THE SIGNIFICANCE OF THE BLACK-BALL.

The black-ball has become of too free use in our medical societies. There should be a more profound sense of its significance; it is a measure of reproach and odium—often cast upon an honored name through unworthy motives.

Our medical societies are medical schools—and their teaching should be as free as the common light that enters through our windows. Our interests are common and not individual. The gradual operation of our many educational agencies will make the culture of the few that of many, the truths of our medical science those of every physician's knowledge. These societies furnish helps and resources—open avenues for the investigation, discussion and development of the many complex questions of medical and surgical science. Closing doors to these institutions is narrow, selfish and un-American. It is resented by the spirit of a generous profession.

The few very fastidious, kid-gloved gentlemen who work their way into these associations for the prestige such membership may give them, need not fear contamination of their Lord Chesterfield manners or compromise of their personal or professional dignity by one who has crossed their professional paths and aroused their jealousy and prejudice or something worse. There is no rule of etiquette, professional or other, requiring that they should invite the more modest gentlemen to take a pretzel with them.

The black-balling class are usually men who will travel long distances to gratify a feeling of personal or professional revenge. Once informed or suspicioning that the subject of their "Royal disfavor" will be a candidate for membership of a particular society, they are on hand and actively engaged in a work of poisoning. They are unscrupulous as to means em-

ployed; they lose no time, spare no effort in bringing the ignominy, the opprobrium of defeat or rejection upon the candidate.

There is no disputing the fact that every body of men organized for a specific purpose, or, in brief, for any line of work whatever, have the inherent right to prescribe the qualifications requisite to admission to membership. In our medical societies these qualifications should be only those of a medical character—and then not extend to *how much* the physician knows—the inquiry should go no further than his legal qualifications. The law has wisely thrown about the profession all needed safe-guards. The only absolute bar should be infamous character, rendered such by grossly immoral conduct. But we hear of very few of the black-balls cast in our societies being upon moral grounds; it is exceptional that the motives governing are not personal. "Now I have a shot at him—and I have canvassed and rallied my friends"—says the man with the black ball. These societies should welcome into active fellowship every graduate of medicine.

There is no danger to be apprehended from weak men. They will find their level, will learn through professional contact how very little they know and will be given some impulse in the direction of improving themselves in the science they profess to practice. The teaching they will receive will make them more efficient in their work—more fruitful in resource.

If such is not the one great central aim, the intent and purpose of all medical organizations, what is? If they are not great schools they fail of any useful purpose. A medical society to represent an ideal educational body, must be broadly democratic in its policy. The more democratic and broadly representative of the profession at large our societies are made, the earlier and more thoroughly will all charlatanism and quackery be stamped out. Frauds upon the profession avoid all danger of hard pounding—they skulk away from the light.

There are many grand men, masters in their profession, who are successfully pursuing their calling about our country hills, and they are men whom a narrow, selfish and often malignant policy keeps out of our medical and surgical societies. The lessons of these men's observations and experiences would be of value to a body of the ablest men of the profession. They are often men of a high order of ability, thoughtful men, whose merits should be brought into public recognition.

The policy being pursued by our medical societies is averse to their healthful growth and defeats the high end these societies were instituted to serve. They should in the fullest sense be representative of general medical development and not only that of a select, exclusive and limited class, a considerable element of which are small medical politicians whose chief ambition is to become a Grand Sachem or a Keeper of the Wampum Belt, and not that of advancing the art and science with which their names and interests are identified.

The self-respecting physician will not attend medical meetings unless he can attend in the honorable capacity of a member; nor will he seek membership in a society where there is a risk of his having the stigma of a black-ball cast upon his private and professional character by those low-motived men of the profession, who are indifferent to the significance of their act; who are so dead to the instincts and promptings of a high professional manhood that they frequently boast of their mean endeavor to besmirch the character of a fellow in the profession. The motives too often governing in these cases are low, selfish, mean, unmanly, unprofessional and cowardly. And the men who use these honored bodies as avenues through which to serve some personal, selfish end, to gratify some vindictive

feeling, personal pique or jealousy, deserve the severe and swift condemnation of the profession.

While much of our science, many of the procedures and great truths that enter into our medical and surgical practice are hereditary, they were not entailed upon any one or any select few of our great family of physicians. No one man can assume the purple and shaking his little wand say "All this is mine." We have eminent men in our American profession whom it is a professional and patriotic pride to honor; they are men who have gained their position by resolute devotion to study and research, and the value of the work of these men lies chiefly in their clinics, their teaching through our medical societies and journals, and the value of that teaching is enlarged as the constituency of our societies and journals is enlarged.

After men pass from the schools there is no educational influence brought to bear upon them more potent than that of our medical journals and medical associations. In associations there is a union of minds, a striking of hands in joint effort to advance our knowledge. In the closer social relationship in which men are brought are found opportunities for improvement; it gives new excitements to endeavor and through it will be corrected many errors and crude opinions. It gives opportunity for the inter-communications of the digested experiences of professionally busy men, the lessons of the year—the results of their hard work, their observation, research and experiment.

There are many men in our rural towns, along our country sides, among hills and mountains, who could teach some of our modern professors. We would have them brought into contact. It would be refreshing to see the blush of ignorance tint a tough cheek. The professor, the shining lights and the hangers-on of our medical societies need not in their own knowingness and because of their few advantages, hold their heads quite so high above the multitude. It is true that it cannot be expected that a man with diseased sight will see much merit in his humbler brother.

This black-balling business has gone quite far enough. We have medical journals, conducted by men of distinguished ability, men alive and devoted to every interest of the profession, and we hope they will have a strong word to say upon a matter that has become a reproach to the profession.

We have great scholarly men at home—*Americans*—at whose feet we can sit for our teaching and need not to go abroad,—let there be no reserved seats where this teaching goes on. We are grateful for many valuable lessons taught by eminent men across the waters, and while we are willing foreigners shall weave some of our fabrics for us, we are not willing that they shall do our thinking for us. These societies are the nurseries of our higher medical education and to them there should be no closed doors.

THE NEW QUARANTINE LAW IN PENNSYLVANIA.

The main features of the bill are as follows:—

First—In view of the prospective establishment at an early date of a thoroughly equipped and effective Federal Marine Quarantine on the Delaware Bay or River, the Governor of the State of Pennsylvania is empowered, when satisfied that the United States has established and is maintaining on the Delaware Bay, etc., an effective and efficient quarantine to secure this Commonwealth against the introduction of pestilential, and contagious and infectious diseases, to suspend by public proclamation the operation of State quarantine in part or in whole at his discretion.

Second—The Governor is empowered under certain circumstances, to lease the Lazaretto Station, which station, however, must be discontinued for quarantine purposes after July 1, 1895.

Third—The Governor is authorized to acquire by purchase, etc., a suitable place on the Delaware River or Bay, either within or without the limits of Pennsylvania, for the establishment of a permanent State quarantine station.

Fourth—The State Quarantine Board is to be constituted as follows: 1, the Secretary of the State Board of Health; 2, the President of the Philadelphia Maritime Exchange, or a member of said Exchange, to be designated by him; 3, the President of the College of Physicians of Philadelphia or a member of said College, to be designated by the president; 4, the quarantine Physician provided for in this act; 5, the Health Officer, appointed in pursuance to the act to which this is a supplement; 6, the sixth member to be appointed by the Mayor of Philadelphia; 7, the seventh member to be appointed by the Mayor of Philadelphia. The members of the Board are to serve for various terms, so that all shall not go out at one time.

Fifth—The State Quarantine Board thus constituted shall make rules and regulations, not inconsistent with the laws of the United States and this Commonwealth, for the regulation and management of the Quarantine Station, etc.

Sixth—The Quarantine Board shall establish an office in the city of Philadelphia.

Seventh—The quarantine physican shall be the executive officer of the Quarantine Station.

Eighth—The time the act is to go into effect is July 1, 1893, from and after which date the officers of the Lazaretto, Physician and Quarantine Master shall cease to exist.

Ninth—Section 13 provides that the power of the Philadelphia Board of Health over maritime quarantine ceases when this act goes into effect.

An appropriation of $35,000 towards the cost of securing a site and equipping the same in conformity with the requirements of this act was passed during the last days of the Legislative session.

TRANSLATIONS.

CONTRIBUTIONS TO THE BIOLOGY OF THE CHOLERA BACILLI.*

The author (Dr. Uffelman) used for his investigations the watery cholera stools from which he obtained pure cholera cultures, using gelatin in solution. His results were as follows: In water such as found in the docks of Rostock and Oberwarnow, the cholera bacilli flourished for the space of from two to six days. If the temperature of the water ranged between 19° and 20° C., the cholera bacilli seemed to increase during the first fifteen or sixteen hours.

It is understood that this water was not sterilized, was motionless and not exposed to the sun.

Second. The milk of the cow is also a fluid in which the cholera bacilli will live for two days, even should in that time the milk become sour. In this medium also during the first twelve to sixteen hours in a temperature of 18° to 22° there is an increase of cholera bacilli.

Third. Upon slices of bread, not covered, the cholera bacilli remained at least one day; if wrapped carefully in paper they lived three days; if placed under a glass globe they lived one week.

Fourth. Upon the surface of slightly rancid butter they could be demonstrated from four to six days; in the deeper parts of the butter they lived but from one or two days.

Fifth. Upon roast beef, if placed under glass globe they were found after eight days. In smoked herring placed under similar conditions, they were living on the fourth day.

Sixth. The surface of fruit, if allowed to dry, will give them but twenty-four to thirty hours; if placed under glass globes they live four days. On fresh cauliflower, according to circumstances, they live one to three days.

Seventh. If placed upon printing paper and allowed to dry between the leaves of a book, they live at least seventeen hours, or

*Translated for The Medical and Surgical Reporter by Marie B. Werner, M. D.

if placed in an envelope and sealed, they live twenty-three and one-half hours. Postal cards, without covering, gives them twenty hours.

Eighth. Upon copper or silver coins as well as upon other metals, the bacilli, if allowed to dry, die in the space of from ten to thirty minutes.

Ninth. Upon dry wearing apparel, woolen or linen, their viability differs with circumstances. If dry, one to four days, if moist they live longer than twelve days; they even increase on moist linens.

Tenth. Flies can carry the poisonous material for two hours, and coming in contact with meat or milk, will infect it.

Eleventh. The dry hand will carry the viable bacillus for one hour. In general, the results obtained by the author's experiments show that the cholera bacilli have greater resistance than at first supposed. —*Berl. klin. Woch.*, 1891, No. 48.

SACRAL OPERATIONS.

Prof. Zerny, af Heidelberg, says in medicine the treatment of malignant tumors have been passed over to the surgeons for cure. The method, of Herzfeld and Hochenegg, for treating tumors of the pelvic cavity by approaching them through sacral resection, has been practiced by surgeons, but not enthusiastically supported by the gynecologists.

Zerny has practiced this method eight times for carcinoma of the neck of the uterus. One woman died of shock, the remaining seven recovered; but one of these recovered has not had a return during the space of three years.

The method of operation may be at fault, in that it may promote a return. Zerny has for this reason adopted the following method:

When more space is required he has found it better to open the right half of Douglass's pouch and separate the soft parts from the uterus, separating the vagina from the growth as the last stage of the operation.

His reason is to prevent infection of the peritoneum with carcinomatous masses. Zerny has performed the sacral, respectively para sacral, method in a number of other operations with good results; for instance, a chronic vesico vaginal fistula, in two malignant growths of the uterine body and in the case of a young girl, aged twenty, for a large deciduoma of the uterus, about the size of a child's head, which resulted immediately after abortion and had formed metastases in the vagina, and for that reason laparotomy could not be thought of. It was very easily treated with the sacral method.

Two adherent myomas, and fixed dermoid tumors were also among the number which Zerny operated on through the sacrum.

The sacrum method is the most direct in such cases in the parametrium, being within easier reach. He also found it useful in removing a tumor of the bladder and in operating twice for atresia of the anus.—(Read at the twenty-second Congress of the German Society for Surgeons, held in Berlin, April, 1893.)—*Deuts. Med. Wochen.*, 1893.

ABSTRACTS.

THE SPECIAL INFLUENCE OF ALCOHOL ON THE BODY.*

T. L. WRIGHT, M. D., Bellefontaine, Ohio.

The subject may be divided into three parts:

1. The effects of alcohol upon the nerves.

2. Upon the blood, and

3. Upon the physical integrity of essential organs and tissues.

First. The influence of alcohol upon the muscular senses is well marked—the movements of the muscles being hampered and paralized by that agent. There is incoordination of movements in the mus-

* Abstract of a Paper read before the American Medcal Association, Milwaukee.

cular system. This is seen in the imperfections of speech and locomotion, and in the incapacity to combine the actions necessary for sewing, playing upon musical instruments, etc.

The vaso-motor system of nerves is always affected by alchohol—sometimes this is observed in flushings, which indicate paralysis—and sometimes by pallor and a spastic state of the capillary system.

Alcohol may also produce neuritis—as, in the tibialis anticus nerve the musculo spiral nerve, and several others. It is plainly injurious to the phrenic, as well as the pneumogastric nerve, causing wide spread functional and structural derangements.

The anæsthetic effects of alchohol upon common sensation, and to some extent upon the several senses, influence very materially the accuracy of perception; and they mislead the mind and judgment in many ways.

Second. Alcohol may produce changes in the appearance of the red corpuscles of the blood. They are deprived of the power to perform their functions physiologically. They may become shrunken, deformed, and incapable of either distributing oxygen, or if eliminating carbonic acid in a healthful and proper manner.

Not only carbonic acid, but other effete and poisonous matters corrupt the blood when the influence of alcohol is prolonged for a considerable time. There is accumulation of carbon, and especially of the hydro-carbons. These may readily undergo slight chemical changes, resulting in the production, at one time, of acetic acid, and again of fat, attended with a disappearance of oxygen, already too scant.

The gouty, or the rheumatic diathesis may become established by contaminations of the blood dependent upon deficiency of oxygen.

The low temperature induced by alcohol, may be partly connected with alcoholic paralysis of certain brain centers; but it is also greatly dependent upon the inçapacity of the circulating fluid to hold oxygen, and to distribute it in the general system.

Third. Physical degenerations from alcohol are numerous.

The heart may be prostrated by absence of the proper physiological rests between heart beats. It may also become the seat of fatty degeneration, also of atrophy. There may be dilatation, attended always with irritable beat and palpitation. The valves, moreover, are likely to be injured.

The liver is often the seat of fatty degeneration in the inebriate. The kidneys may suffer in a similar manner. Both the liver and kidneys may be the seats of sclerotic degenerations, attended with contractions and indurations.

The connective tissue may undergo a process of hyperplasia under the influence of alcohol. This condition is likely to be associated with a variety of functional mishaps. But the contraction, which subsequently takes place in the enlarged fibrous substance, is much more injurious. The gradual contraction of the interstitial tissue, especially in the liver, the kidneys and the brain, produces consequences of the most disasterous nature; which are the more to be deplored as they are necessarily incurable.

The inebriate brain may present the appearance of the senile brain, there being atrophy and superabundance of serum.

The membranes of the brain, including the dura mater, may be abnormally adherant and thickened, while the brain itself may present "patches of apparent sclerosis, and other evidences of injury due to alcohol, which resemble the apperances seen in the brains of paretics."

Stranger.—I notice you call your friend Professor. Is he really a professor?

Boweryite.—I should say so. Why, dat feller swollers a sword 18 inches long, stands on his ear and eats glass out of a churn. Professor! Well I should smile.

Suicides of School Children in Germany.

During the last eight years, 289 school children committed suicide in Germany; of these 49 were girls. The causes assigned were: fear of punishment, 80; mental disease, 26; morbid ambition, 19; fear of examination, 16; practical joking, 7; disappointed love, 5. This record is scarcely surprising considering the severe educational requirements of the schools in the fatherland. It is a terrible indictment against "over pressure," the effects of which can scarcely be expected to be limited to those children who are driven to destroy themselves.—*Dublin Journal of Medical Science.*

CURRENT LITERATURE REVIEWED.

LANPHEAR'S KANSAS CITY MEDICAL INDEX for May, contains a paper by Dr. D. J. Hamilton, of Aberdeen, Scotland, on "Asiatic Cholera." The paper considers the source of the disease; the recent epidemic; the cholera germ; the advantage of the early recognition of the organism in a fresh outbreak; and the importance of distinguishing between this spirillum and others found in the human body. The paper concludes with a warning against the danger of a bad water supply.

Dr. Lewis Schooler contributes a clinical lecture on "Compound Fracture of the Skull with depression; Fistula in Ano, with operation under cocaine; and Syphilitic Adenitis."

Dr. J. F. Binnie presents the report of a

Peculiar Course taken by a Pistol Bullet through the Abdomen.

The patient had first received a wound oevr the left eyebrow, the bullet smashing the outer table of the skull and emerging at a poin t about one inch from the wound of entrance. The range was so short that the face was tottooed with powder. Nothing of interest was noted in regard to this wound.

A second wound was found on the right side of the chest in front, and the course taken by the bullet, which inflicted this wound, is of peculiar interest.

The bullet first went through two woolen shirts carrying with it a small portion of each, and entered the body at a point on a level with the ninth rib, midway between the right mammary and the anterior axillary lines. At a point almost exactly opposite the wound of entrance, situated on the back about 2½ inches to the right of the spine the bullet could be felt under the skin. The patient was somewhat collapsed but not markedly so.

Under the usual antiseptic precautions the wound of entrance was enlarged and it was found that the 9th rib had been perforated by the ball. This portion of rib was now excised with the rongeurs and the pieces of shirting carried in by the missile removed. The pleura was seen to be uninjured but the diaphragm was perforated and omentum made its appearance in the wound. No wound of the liver was apparent. In order to follow the further course of the bullet and to see whether the intestine was perforated or not, an incision through the abdominal parietes was made external to the right linea semilunaris and the intestines were, on examination, found uninjured. A quantity of clotted blood in the abdomen was removed.

Next an incision was made over the bullet (38 caliber Smith & Wesson) and it was readily extracted. The track of the bullet could be followed, from this last incision, with the finger, for 3½ inches, but nothing of importance was revealed. The laparotomy wound was closed with buried and superficial continuous catgut sutures. The wounds in the diaphragm and in the chest wall were closed in the same manner. The posterior wound was closed with interrupted silk sutures and drained with iodoform gauze. Dressings applied were of iodoform and bichloride gauze, with absorbent cotton externally.

On the evening of the same day, bloody urine was voided showing that there must have been some bruising of the right kidney. The patient recovered.

Dr. H. C. Crowell contributes the

Report of Cases of Myoma Uteri.

His method of operating is illustrated by the following report of a case:

"Adhesions freed, the broad ligaments were tied off on either side with floss silk; the uterine arteries tied, bladder separated and uterus drawn well up and forward, I passed down posteriorly to the uterus to the utero-vaginal junction where I thrust a sharp-pointed scissors through into the vagina and spread them enough to admit my fore-finger. I then cut either way around the cervix with curved scissors, freeing the vaginal attachment to the uterus. The pelvis was then thoroughly irrigated and the ligatures, left long, were passed down into the vagina with iodoform gauze packed lightly in the pelvis as drainage. The abdomen was then closed and patient put to bed and maintained upon an incline planed to favor drainage. The gauze was removed on the third day. After the gauze was removed it was noticed that urine also escaped from vagina, indicating that somewhere injury had been done to the urinary apparatus, which fact simply indicates that greater care should have been observed, and does not in any way militate against the operation. The steps of the operation after adhesions were disposed of were easy and rapid. The convalescence exceptionally free from any complications. Patient walking about in fifteen days. By quiet, urine ceased to flow from the vagina, fifty-six ounces being secured from the bladder in twenty-four hours.

The method employed is that devised by Dr. Florian Krug. The author thinks this operation approaches the ideal method. He thinks catgut should be substituted for silk in ligating the broad ligaments, and the inverted peritoneal surfaces should be stitched together to completely shut off the peritoneal cavity and render less liable a possibility which is by the method employed practically evil, viz: intestinal adhesions. He feels that total extirpation has not a few superior points of advantage over any other method.

Dr. William J. Taylor presents the "Report of a Case of Fracture of the Thyroid Cartilage" which has already appeared in the MEDICAL AND SURGICAL REPORTER for May 6th, 1893, page 694, in the Transactions of the Philadelphia Academy of Surgery.

Dr. Emory Lanphear contributes the report of "Four Cases of Bloodless Amputation at the Hip," illustrating the article with wood cuts showing the various steps in the operation.

Dr. John Punton reports "A Case of Hysterical Aphonia in the Male."

PRACTICE FOR MAY

contains an article by Dr. Wallace A. Briggs on

Uterine Tinkering; What it is and what it is not.

He says: Uterine tinkering and its synonym, meddlesome gynecology, include every form of uterine treatment that does not seek to accomplish a rational end by rational means. Easily foremost among the forms of uterine treatment which are neither rational nor scientific, is the routine use of the applicator. In conditions in which this instrument is ordinarily employed, the endometrium practically constitutes the walls of an abscess cavity. A muco-purulent secretion constantly pours into this cavity and escapes through the cervical canal. In passing the cervix the medicament is mostly expressed from the cotton, which passes on into the uterus, gathers a little mucus or muco-pus, abrades the mucous membrane at several points, and is withdrawn. Such applications are harmful even when seemingly most beneficial, for their curative influence is wholly restricted to the canal of the cervix which, as it improves, contracts and hinders drainage—the most important element in the treatment of uterine catarrh. Another form of uterine tinkering, less prevalent but equally reprehensible, is the introduction into the uterine cavity of sticks of lunar caustic. The best that can be reasonably expected of it is uterine colic and inflammation. Medicated bougies and medicated injections, unless for the purpose of cataphoresis, swell the formidable list.

Sponge, laminaria and tupelo tents are all quite as capable of doing harm as good, and should be used with the utmost discrimination. The form, size and position of the uterus can usually be determined without the use of the sound. Its use is ordinarily meddlesome, and without the strictest antiseptic precautions is always so. Hysterectomy for fibroids, before the thorough and conscientious trial of electricity, is more than uterine tinkering, more than meddlesome gynecology—it is unwarantable imperiling of human life. Total hysterectomy in the late stages of uterine cancer is likewise meddlesome. Exploratory incision is often meddlesome and often a mere lion's skin to cloak carelessness or incompetence in diagnosis. In regard to what uterine tinkering is not, he says: It is not antiseptic irrigation of the vagina in its appropriate conditions. It is not the promotion of uterine drainage. It is not the restoration and maintenance of the normal axis and position of the uterus. It is not hydroscopic and antiseptic depletion by means of glycerine, borax or boracic acid. It is not curettage. The author also includes in the procedures which he thinks are not uterine tinkering, the Apostoli method of dealing with fibroids and the application of electricity generally in the treatment of pelvic neuroses. The so-called conservative treatment of diseased tubes and ovaries is also not uterine tinkering.

Dr. Herbert Terry discusses the subject of

Puerperal Eclampsia.

In the treatment of puerperal convulsions prevention is better than cure, and the premonitory symptoms are of vast importance. They differ very little from those found in uræmia from Bright's disease—headache, and other disturbances of the nervous system, *e. g.*, wakefulness, stupor, restlessness, delirium, and muscular twitchings; disturbances of vision, *e. g.*, sparks or dark spots before the eyes, dimness of vision, or even blindness; vomiting or diarrhœa; œdema, which is of especial significance if occurring in the hands or face; albuminuria and renal insufficiency. The earliest and most frequent danger signal he believes to be the renal insufficiency, and this is even more than a symptom; it is a determining cause. During pregnancy the patient or her friends should report any unusual condition, and especially any of the symptoms enumerated above, and the physician should consider it a duty after the fifth month of pregnancy to make frequent examinations of the urine, especially in regard to quantity and specific gravity. The skin should be kept in good condition by frequent baths and rubbing. The bowels should be kept open if necessary with saline cathartics. Flannels should be worn next the skin, and any danger of "catching cold" from drafts, wet feet, or chilling the surface of the body, should be carefully avoided. The food should be in good quantity, varied, and easily digested, and the digestion kept in as good condition as possible.

If any of the premonitory symptoms of convulsions enumerated above should occur, there is still more reason for looking after the skin, bowels, and kidneys.

If the symptoms are marked we may have recourse to hot baths, diuretics, *e. g.*, digitalis, nitrate of potash, colchium or Basham's mixture. Perhaps the most common diuretic is cream of tartar, which also acts very satisfactorily on the bowels. The diet is of great importance, and theoretically meat should enter into it but sparingly. The blood should be washed out with water, Vichy water, lithia water, and the like. If the symptoms do not subside the question of premature labor comes up. The author believes in inducing labor if the child is viable. If the child is not viable, more delay is not only admissible but imperative. If premature labor is decided upon, the patient is best prepared by the administration of a brisk hydrogogue cathartic. The author prefers croton oil or elaterium in full doses. This may be followed, if needed, by sufficient chloral hydrate and bromide of potash to quiet the nervous system. If convulsions actually occur, there is no question of the advisibility of emptying the uterus at once. The use of veratrum viride, in subcutaneous doses of ten to twenty minims of the tincture every half hour till the pulse is reduced to 60, is suggested in place of bleeding. Pilocarpine has given good results in the author's hands.

Cathartics, especially croton oil and elaterium, have proved of great value as eliminants. Neither acts so quickly as to prohibit the use of chloral by the rectum, or pilocarpine subcutaneously.

To quiet the nervous system morphia has been used in large doses and has proved itself of value notwithstanding its alleged danger in uræmia.

Chloral, with or without bromide of potash, has been almost universally advised. At least a drachm of chloral should be given by enema as soon as possible, or, if the patient can swallow, forty grains by the mouth. Its effect can be noticed within half an hour.

Chloroform or ether may be given to control the convulsions, but they are not to be compared with the chloral in definiteness of dose or prolonged effect.

As adjuvants to the treatment, dry cups or digitalis poultices over the region of the kidneys seem to be of use. If there were too much depression, perhaps from the use of pilocarpine or veratrum viride, the subcutaneous use of strychnia or citrate of caffeine (itself a powerful diuretic), may be of advantage.

This issue concludes with a paper by Dr. Leon Brinkmann on "The Aseptic Preparation of some of the Materials employed in Surgery."

PERISCOPE.

MEDICINE.

Cocaine Antidotes.

S. Mitchell has found that while ammonia, digitalis and brandy will relieve the milder toxic manifestations of cocaine poisoning, they signally fail when these systoms are superceded by severe præcordial pain, weak and rapid pulse, sighing respiration, borborygmus and belching of wind, muscular rigidity, and later paralysis of the whole body, except the brain, which is unaturally active. In such a case he used a large teacupful of clear coffee, and has found it equally efficacious on subsequent occasions. It can be administered cold or hot. He makes no mention of amyl-nitrite.

Gluck advocates dissolving the cocaine in a three per cent. solution of phenol. This, he claims, prevents the toxic effects of the former drug and renders the solution stable; as it is well known, such solutions otherwise lose their anæsthetic effects after twenty-four hours. Phenol, besides has a certain anæsthetic power of its own, forms a superficial eschair, which prevents absorption of the cocaine, destroys bacteria, fungi, etc., prevents decomposition in the solution, renders it aseptic, and wards off reactive congestion.

—*Med. Record.*

The cry of children, according to Dr. E. C. Hill, in pneumonia and capillary bronchitis is moderate and peevish and muffled, as if the door were shut between child and hearer. The cry of croup is hoarse, brassy and metallic, with a crowing inspiration. That of cerebral disease, particularly hydrocephalus, is short, sharp, shrill, and solitary. Marasmus and tubercular peritonitis are manifested by moaning and wailing. Obstinate, passionate, and long-continued crying tells of earache, thirst, hunger, original meanness, or the pricking of a pin. The pleuritic is louder and shriller than the pneumonic, and is evoked by moving the child or on coughing. The cry of intestinal ailments is often accompanied by wriggling and writhing before defecation. Exhaustion is manifested with a whine. Crying only, or just after coughing, indicates pain caused by the act. The return or inspiratory part of the cry grows weaker toward the fatal end of all diseases, and the absence of crying during disease is often of graver import than its presence, showing complete exhaustion and loss of power. Loud screaming sometimes tells of renal gravel.—*Denver Medical Times.*

SURGERY.

After-Effects of Chloroform.

Dr. Luther (*Munch. med. Woch.*) says that changes are found in the kidneys after death by chloroform, however produced. He says that almost after every administration, especially if prolonged, albumen and casts appear in the urine. The author has found that (1) the urine was normal when no after-effects, such as vomiting, etc., were present; (2) of many cases examined, the after-effects were most marked in the single case in which abnormal constituents were found in the urine; (3) albuminuria and cylinduria go hand in hand, and disappear after a few days, and (4) the casts are mostly hyaline. He concludes for these reasons that (1) the use of chloroform should be limited to cases where it is necessary; (2) in every case before prolonged narcosis the urine should be examined, renal disease being a more important contra-indication than heart disease (except fatty heart); (3) chloroform narcosis should be restricted in the case of the pregnant and lying-in, and it should be absolutely avoided in eclampsia, since it must be prolonged, and the kidneys are nearly always diseased; and (4) mild diuretics are of value in the after-effects of chloroform.

Chloroform as a Hæmostatic.

As a general hæmostatic for the controlling of external bleedings, arterial, venous, or capillary, chloroform is most valuable. Applied on a dossil of lint or cotton wool to the bleeding surface, it promptly stays the blood, acts as a direct stimulant to the patient, and leaves no blood crust to fall off and recommence the bleeding. It is peculiarly suitable for all abdominal operations, as it has no tendency to excite inflammation either in the part to which it is applied or to any of the surrounding tissues.

As an antiseptic application it is more powerful than bichloride of mercury solution. The addition of gum resins has been suggested, but they would detract from the value of the application instead of increasing it, for the reasons which will occur to any person familiar with the use of solutions of gum resins.—*Med. Press and Circul.*

On the Use of Thiersch's Skin-Grafts as a Substitute for Conjunctiva.

Dr. F. C. Hotz, of Chicago has had very satisfactory results in grafting according to the method proposed by Thiersch. (It must be remembered that the grafts consist only of "the epidermis and the tips of the papillæ.") The advantages claimed in favor of grafts of this kind over those of mucous membrane are, their greater vitality, greater simplicity of process, and the higher percentage of success.

Dr. Hotz reports four cases in this article in which he employed this method. The operation was performed for the following conditions:

1. For the relief of extensive adhesion of the lower lid to the eyeball (symblepharon) following the destruction of the palpebral and ocular conjunctiva by lime or hot metal.
2. For the relief of the excessive shrinkage of the conjunctiva in trachomatous eyes.
3. Thiersch's grafts can be used for enlarging a contracted conjunctival pocket, to make the insertion of an artificial eye possible.
4. Thiersch's grafts may be used in certain cases of pterygium.—*Ann. Ophth. and Otology.*

NEWS AND MISCELLANY.

Dr. G. Betton Massey will open a summer annex to his sanitorium at Paoli, Pa., June 1st, to remain open during the hot months.

ARMY AND NAVY.

U. S. ARMY FROM MAY 28., 1893, TO JUNE 3, 1893.

The leave of absence on surgeons ceritficate of disability granted Major James P. Kimball, Surgeon U. S. Army, is extended two months on surgeons certificate of disability.

Captain Jefferson D. Poindexter, Assistant Surgeon is relieved from duty at Fort Nebraska, and will report in person to the commanding officer, Fort Bowie, Arizona, for duty at that post.

Major John Brooke, Surgeon, is relieved from duty at Fort Leavenworth, Kansas, and will repair to Philadelphia, Pennsylvania, and enter upon temporary duty as Attending Surgeon and Examiner of Recruits in that city.

Leave of absence for one month is granted Lieut. Colonel William D. Wolverton, Deputy Surgeon General U. S. Army.

Leave of absence for fifteen days, to take effect upon his relief from duty at Fort Bowie, A. T., is granted Captain Richard W. Johnson, Assistant Surgeon.

1st Lieutenant William F. Lewis, Assistant Surgeon, (recently appointed) will proceed from Kinston, North Carolina, and report in person to the commanding officer, Fort Assinniboine, Montana, for duty at that station.

Leave of absence for four months, on surgeon's certificate of disability, is granted Captain Curtis E. Price, Assistant Surgeon.

Captain William C. Shannon, Assistant Surgeon, now in this city, is relieved from further duty at Fort Apache, Arizona Terry., and will report in person to the Surgeon General for duty in his office, vice Captain Harry O. Perley, Assistant Surgeon, who at his own request, is relieved from duty in that office, and will report in person to the commanding officer, Plattsburgh Barracks, New York, for duty at that station.

By direction of the President, Captain William C. Shannon, Assistant Surgeon, is relieved from further duty under the Intercontinental Railway Commission, appointed under the provisions of the act of Congress approved July 14, 1890.

The World's Fair.

FINAL ARRANGEMENTS FOR THE SALE OF TICKETS VIA THE B. & O. R. R.

For the benefit of those desiring to attend the World's Fair the Baltimore & Ohio Railroad will sell Excursion tickets to Chicago and return, at all stations on its line, at low rates. Tickets will be on sale until November 1st, and will be valid for return journey until November 15th, 1893. They provide for a reduction of 20 per cent. below regular rates. These ticket will be valid only for continuous journey. Tickets at higher rates will be sold that will permit holders to stop over at Baltimore, Washington, or any other point, going and returning.

Besides the opportunity of visiting Washington, a privilege afforded by no other route, tourists via the Baltimore & Ohio Railroad will traverse the historic Potomac Valley, the theatre of the war between the States. At Cumberland they will be offered a choice of routes, via Pittsburgh, or across the Allegheny mountains, 3,000 feet above the level of the sea and via Deer Park and Oakland, the famous summer resorts. The scenery along the Baltimore & Ohio route is the most picturesque in America. Pullman accommodations may be reserved in advance of journey. For rates and information apply to nearest B. &. O. Ticket Agent, or Chas. O. Scull, General Passenger Agent, Baltimore, Md.

SVAPNIA

OR

PURIFIED OPIUM

FOR PHYSICIANS USE ONLY.

Contains the Anodyne and Soporific Alkaloids, Codeia, Narceia and Morphia.

Excludes the Poisonous and Convulsive Alkaloids, Thebaine, Narcotine and Papaverine.

SVAPNIA has been in steadily increasing use for over twenty years, and whenever used has given great satisfaction.

To PHYSICIANS OF REPUTE, not already acquainted with its merits, samples will be mailed on application.

SVAPNIA is made to conform to a uniform standard of Opium of Ten per cent. Morphia strength.

JOHN FARR, Manufacturing Chemist, New York.

C. N. CRITTENTON, Gen'l Agent, 115 Fulton St., N. Y

To whom all orders for samples must be addressed.

SVAPNIA IS FOR SALE BY DRUGGISTS GENERALLY.

NO WAX

Is used in our **Hollow Suppositories.** Made from purest **Butter of Cocoa only,** which **melts** at the temperature of the **body.** Can be filled with any medicine. Anal, Nasal, Urethral, Cystic, Vaginal, and Intra-Uterine sizes.

Also, Ricord's Solid Suppositories for Gonorrhœa, and Nelaton's Solid Suppositories for Constipation and Piles. Samples sent Free on application and mention of this paper.

REST *VS* EXERCISE IN THE TREATMENT OF PULMONARY CONSUMPTION.

THOMAS J. MAYS, M D.,* Philadelphia.

It is not too much to say that he who takes a sober view of the nature of consumption knows very well that it is not a question of lung disease so much as it is one of constitutional depravity. The wasting, the general weakness, the easy fatigue, the occasional painful tiredness of the whole body on slight exertion, the shortness of breath which is out of all proportion to the area of lung which is involved; the slight rise of the evening temperature, the loss of appetite, and the chilly and creepy sensations along the back and over the whole body, all point out plainly that the whole constitution is at fault from the very beginning of the disease. Consumption is, therefore, a wasting trouble, not only of the lungs but of the whole body. The consumptive may possess a considerable amount of strength, but this has no staying qualities. It is easily dissipated and the whole course of the disease indicates the existence of a serious error in that portion of the body which has to do with the accumulation and distribution of energy. This fault, I believe, resides principally in the nervous system. I regard the sufferer of this disease in the same light as I do the individual who is approaching the border of financial bankruptcy. With the former it is a question of spending too much physiological capital, while, with the financier it is a question of spending too much moneyed capital. If these conditions are alike, as I believe them to be, what is to be done? What is the remedy? Can the financier expect any possible relief if he continues his course of extravagance? No. He must, in order to save himself from going to the wall, do either one of two things. He must either increase his income, or restrict his expenses. If he does both he will redeem himself in a shorter time. The same principal of treatment applies to the consumptive. In order to get well he must improve his physiological capital. By this is meant that he must recover the flesh and strength which he has lost. He can accomplish this either by increasing his income, or by diminishing his expenditures. If he does both of these things he will attain his object soonest.

Now in what do his income and expenditures consist? His income consists in the food and air which he consumes in building up his body and in keeping it at par; and the latter consist in the quantity of the force which he consumes in maintaining the machinery of his body in motion. It is evident, therefore, that the amount of his expenses will depend on how much machinery is kept in motion. Now what comprises the machinery of the body? Principally innervation, respiration, circulation, digestion, and voluntary muscular motion. From this it is clear that a certain part of the machinery, like innervation, breathing, circulation, and

* Professor of Diseases of the Chest in the Philadelphia Polyclinic, and Visiting Physician to the Rush Hospital for Comsumption.

digestion are essential to the existence of life, while voluntary movements of the body are not. The integrity of the former, must therefore, be kept up, while the latter may be cut off. The stopping of this is indeed a great saving of bodily energy, because a vast amount—probably one-fifth of it—is given off by muscular labor expended in walking, etc.

The treatment of this danger of physiological bankruptcy in the consumptives is obvious enough. The prudent financier, who is in danger of insolvency, by pruning off all unecessary expenses, and by increasing his capital stock by degrees, will grow and develop in financial strength, and will sooner or later be in a condition to compete again with his more fortunate neighbors. The same line of action must be followed in managing the consumptive. We must check his expenses and increase his capital. This is done (1) by placing him at rest, and (2) by increasing the amount of his food. As the province of this paper is to dwell on the influence of rest in the treatment of phthisis, very little will be said of the important part which food plays in the same relation.

Text-books on the practice of medicine as a rule are silent on the value of rest in the treatment of phthisis, and those who refer to the subject condemn it by advocating the great usefulness of physical exercise. So far as I know Dr. Brehmer, of Göibersdorf, was the first to introduce the method in this disease, although his chief idea in carrying it out at first was to shield the weakened heart from overwork. More recently, however, it is evident from his writings that he employed it for the purpose of encouraging the bodily strength. Dr. Wier Mitchell in his little book on *Fat and Blood* recommends the rest cure in some cases of phthisis. He says (p. 93) "I have ventured, without much hope, to treat three cases of phthisis in the same manner. There are cases of this nature in which exercise wearies . . . . and I believe that sometimes, and especially in the very earliest stages of consumption, my treatment will save a percentage of such people." He refers to three cases which he treated in this way. One got well and remained well. One after improving in all respects relapsed on account of repeated bleeding from piles and rectal fissure, and another one improved sufficiently to resume his work. In a paper "*On the Treatment of certain Forms of Phthisis Pulmonalis by Rest and the Internal administration of atropine,* by Dr. Roberts Bartholow, published in *The American Journal of the Medical Sciences* of April, 1877, (p. 436) the author speaks very highly of the value of rest. He says: "active exercise is hurtful in phthisis when there is present any considerable fever. Quiet of mind and repose of body, as far as they can be secured, are essential to the curative treatment of this disease. "He cites two cases and refers to others which he treated successfully according to this method in connection with the administration of atropine. Dr. A. Vollaud, of Davos, who has had a large amount of experience in the treatment of consumption in that famous resort, states in his brochure on *The Treatment of Pulmonary Consumption in High Altitudes* (p. 18) that rest is the first obligation of the patient, and if possible this should be taken in the open air. Dr. Dettweiler, who is proprietor of the institution for consumptives at Falkenstein, in Germany, uses the following language on this subject in his work on the *Treatment of Pulmonary Consumption* (p. 85). "More important than all drug treatment is absolute rest of the feverish patient in the fresh open air." The January number of the *Climatologist* for 1892 contains the report of an interesting discussion, by various members of El Paso(Colorado) County Medical Society, on a paper read by Dr. J. M. Keating, the subject of which being "The Rest Cure in the Treatment of Incipient Phthisis." There was a unanimous expression of opinion in favor of rest as a curative agent in this disease, and among the many judicious remarks that were made were the following by Dr. Tucker, which on account of their appliability to the subject under consideration, I will take the liberty of quoting: He says "I might say that my attention was directed to this subject about 18 years ago in a manner very mortifying to myself. A gentleman with incipient phthisis placed himself under my care and was advised the then orthodox treatment, sunshine, fresh-air, exercise, etc. Failing to improve after a short time he consulted an irregular practitioner, who at once put him to bed and kept him there, the sole medication as I afterwards learned, consisting in the use of veratrum viride to control the pulse.

As the result of the change of treatment there was soon great improvement, and so far as I know the patient is alive to-day. This was the first time my attention was called to the value of rest in the disease under consideration, but I have frequently since had opportunities of estimating its true worth, particularly in Colorado."

So far as my personal experience is concerned with the rest treatment in phthisis I may say that I have been led to adopt it during the last seven years on account of the unsatisfactory results which I obtained from other modes of treatment. In reviewing my experience before that time I believe that much of the success which I think I had in treating this disease was, at least, partly attributed to the rest which was necessarily though unconsciously enjoined on my patients. Whatever the prevailing line of treatment may have been there was always, at least in the begining, a certain amount of rest with it in the form of lying in bed, or sitting in the house. This was especially the case in the fall, winter, and early spring, when out-door life is naturally discouraged by the inclemency of the weather; but still the ruling idea was to get the patient strong enough to exercise in the fresh, open air, and hence there existed a constant anxiety to get out, and every fine day was eagerly utilized for this purpose. I often perceived that patients who, after being kept quiet for some days and who were believed to be abundantly able to take the supposed needed out-door exercise, almost invariably relapsed when they undertook to do this, and after a number of disappointments of this sort, I came to the conclusion that my error consisted in not systematically controlling the physical movements of my patients when I allowed them to resume activity. It is strange how often we fail to recognize the true cause for our success and failure. More than fifteen years ago one of the most practical physicians of my acquaintance, in accounting for his good results in the treatment of phthisis, which I knew he obtained, said to me, "if I can succeed in making my patients sit in the house for a certain length of time and watch the thermometer so as to maintain a uniform range of temperature day and night, I generally succeed in restoring them to health." The essential idea of his treatment was to envelop the patient in an even temperature, but he failed to recognize, as I did too, that it was not so much this as it was the bodily rest which accompanied the procedure. I am quite sure from my own more recent observation that if he had compelled his patients to do an active physical exercise at the same time his results would have been less fortunate.

The idea of exercising the consumptive for strength is a fallacy of the worst type. It is based on the assumption that because, in health, exercise gives strength, therefore the invalid must derive the same benefit. Nothing can be further from the truth, and to illustrate this I can do no better than to draw another example from the field of failure. It goes without saying that money makes money. The banker puts his money on interest, or in other words, he exercises his capital and by so doing he increases his financial strength; but the poor man has no money to put on interest, and he struggles along from year to year for the purpose of making a decent living. This parallel holds good between the man in health and the consumptive. The former has a sufficient amount of reserve physiological capital which he can expend in physical exercise, and we all know that physiological activity not only brings strength, but builds muscular tissue,—hence by doing this he enhances his normal resources; but the latter has no reserve capital whatever, and so, as has already been said, on the brink of physiological dissolution. In his exhausted state he lives from hand to mouth, for he consumes all the force which he obtains from his food in carrying on the functions which are necessary to a bare existence. Exercise in his case is therefore meaningless in a physiological sense, and can leave no other than a disastrous effect on his already drained and devitalized constitution.

In the practical application of rest in phthisis much of our success will depend on whether we adopt it properly to the needs of each individual. No iron clad law can be laid down in this matter. Whether it is best to place a patient on absolute rest, or whether to allow him to exercise under proper restrictions, are questions which must be decided by his condition. The cardinal principle to be followed in choosing between the two plans is as to whether the former or the

latter, or a mixture of the two, will place him in the best possible position in which he may regain his lost flesh and strength, and have his bodily expenditures reduced to the lowest point consistent with life. His physical state and power of resistance will help us much in determining this problem. If the disease in the lungs is trivial, if there is only slight constitutional disturbance, moderate fever, and not too great a tendency to become tired on exertion, there is present a greater power of resistance to disease than if there is a great deal of lung mischief, or much constitutional depravity, combined with a persistent sense of exhaustion. A patient in the latter condition must be placed in complete repose on his back; while it is probable that one in the former condition may be treated successfully with a less rigid observance of the rest treatment. It is a safe rule, however, to place all such patients in bed at the very outset, and allow them to sit up or walk about as soon as they are able. Their ability to do these things can only be found by testing it. One of the best indices in governing our action here is the state of the temperature. If this is persistently above 100° in the evening, or rises on slight provacation, they are not fit to undertake those ordeals. It is astonishing often how readily the temperature is disturbed in such patients. I have observed on a number of occasions that if they take a brisk walk, run up stairs, or swing dumb bells for five minutes, the temperature will rise from a degree to a degree and a half in the course of a short time, even though it had been at or near the nominal point before.

I am often asked if phthisiscal patients take kindly to the rest treatment, for it is generally believed that a practice which is so much at variance with the prevailing custom of managing this disease surely meets with opposition. In answer to this I must say that it is very exceptional to find a patient who is not willing to submit to it after he fully realizes his true situation, and comprehends the rational basis of the proposed procedure. The almost invariable improvement which follows the immediate application of the remedy stimulates the hope that still greater amelioration will come and more than compensates for the monotony to which it sometimes gives rise. Indeed, instead of he treatment being tedious I find that my patients are usually contented and happy. Care is necessary that social intercourse is not curtailed too much, that they are given enough of innocent amusement. They read, converse, play chess, dominoes, cards and checkers, are allowed to see their friends, if there are not too many, and are permitted to enjoy themselves, so far as enjoyment can be carried on in bed. If their lungs are extensively involved, and especially if any tendency to hæmoptysis exists, they are cautioned against the strain of hearty laughter. Music has a quieting and restorative effect on this class of patients, and they should be frequently given the opportunity of listening to entertainments of this character.

In addition to the rest treatment, my patients also receive food of the most nourishing kind, such as freshly-expressed beef juice, beef powder, beef steak, milk, eggs, oysters, etc., as well as drug medication and hygienic management, but as these subjects are not embraced in the title of this paper I will dismiss them with this brief reference.

In conclusion I will, instead of going into details, give a brief summary of what rest, in connection with the other treatments referred to, has done for those of my phthisical patients who have made the most marked improvement during the last eighteen months.

Mr. T., aged 16, gained fifteen pounds in two months, and his family physician, who brought him home, says he is cured. He was in the incipient stage, and is free from a family history of the disease, and was kept in bed three weeks.

Mr. O., aged 30, gained sixteen pounds and three-fourths in four months, and the disease is arrested. He is at work. No family history. Kept quiet for about two months.

Mr. K., aged 34, gained twenty-two pounds in five months and has been working for a year, and every vestage of this disease has disappeared. He was kept at rest for a month and a-half. Lost two sisters from consumption.

Mr. N., aged 22, gained eleven pounds in six months. His disease is arrested, and he has been working during the last four months. Rested in bed four weeks. No family history.

Mr. S., aged 18, gained sixteen pounds and three-quarters in six months, and the

disease is believed to be permanently arrested. Remained quiet three months. His mother died of consumption.

Mr. P., aged 35, gained fifteen pounds in seven months, and has been working during the last five of these. He is practically cured. Rested two months. Lost a brother from consumption.

Mr. S., aged 28, gained twenty-nine and three-quarter pounds in four months. His disease is arrested and he has been working since the beginning of last January. In bed six weeks. No family history.

Miss M., aged 24, gained twenty-one pounds in five and a-half months, and is practically cured. In bed six weeks. No family history of the disease.

The last seven cases were in the advanced stage of the disease, *i. e.*, there was pronounced pulmonary infiltration in all but the last one, and all of them were greatly emaciated.

Mrs. E., aged 34, gained twenty-seven and a-half pounds in one year. She had a bad family history. Her disease is arrested and she is able to attend to her household duties. She was kept very quiet for six months.

Mrs. E., aged 30, gained twenty-two pounds in six months, and had been able to attend to light work around the house. Her disease, nine months after I saw her, was arrested, and her husband took her to Colorado against her wishes in order to restore her entirely. The mountain climate failed to agree with her and in a few months she lost more there than she had gained, and a few months ago she returned to her home, and probably to die. She spent three months in bed and on a lounge.

Mr. L., aged 22, gained twelve pounds in about six months. Beside the pulmonary disorder he suffered persistently for nearly three months from diarrhœa—having as many as four and five stools a day during that time. This has ceased entirely, and the pulmonary disease is arrested. He was kept on his back for three months. No family history of the disease.

Mr. B., aged 27, gained nineteen and a-half pounds in one year. He was in bed for ten weeks. His disease is arrested. No family history of the disease. The four last cases were all in the far advanced stage of phthisis, all except the second last having cavities in their lungs.

The results in these twelve cases give us a fair idea of what rest combined with other appropriate treatment can do in phthisis. In the aggregate these patients gained 228 pounds, or an average gain of nineteen pounds for each patient. I am of the opinion that the strongest recommendation in favor of any line of treatment for the phthisical is its power of increasing the weight, although it must not be condemned because it fails to bring this about in every instance. Indeed, I have had cases who did no more than hold their own in weight under this treatment and yet went on to recovery. A marked case of this kind was Mrs. T., aged 25, who was taken sick fifteen months ago with phthisis. She was kept in bed for a little more than two months, during which time a cavity formed in her right lung. At first she lost a few pounds but subsequently made it up again, and at present she weighs about as much as she did when she was first taken sick. Her disease is completely arrested and she has been able to attend to her household duties for the last seven months. On the whole my experience teaches me that men are more apt to gain than women.

Finally, in thus advocating the great value of rest in the treatment of pulmonary consumption, I do not mean to say that exercise is to be universally condemned, but I do wish to lay stress on the fact that we are too prone to apply it too early, and therefore improperly, and that it is a measure which is more applicable to the management of the convalescent than to the active stage of the disease.

No wonder Time is represented as haggard and worn out; a watch keeps time, the chorister beats time, the clock strikes time, trains run on time—not all, but some of 'em—the foreman lays out time, horses run against time, people threaten to do things if they get time, at a prize fight they call time, soldiers mark time, criminals serve time, few can spare time, everybody now and then tries to kill time and perhaps your subscription is behind time.

As Mrs. Partington was gazing upon St. Paul's Cathedral in London, she remarked rapturously: "O, venereal pile! Gigantic stricture!" — *N. Y. Sunday Mercury.*

COMMUNICATIONS.

INDIVIDUAL EXPERIENCE IN THE TREATMENT OF VESICAL CALCULUS.*

JOHN ASHHURST, Jr., M. D.

I find in looking over my records that I have removed calculi from the human body in fifty-one cases. One case was that of a female child, on whom I performed lithectasy, or rapid dilatation of the urethra, but the remaining fifty were in male subjects. In thirty-five of these fifty cases the patients were operated on by lateral lithotomy, which is the cutting operation that I prefer. I recognize that there are cases in which the median operation is to be preferred, and that there are other cases in which the supra-pubic operation is the best; but where the surgeon has the choice of operation, I think that he should select lateral lithotomy. Of the thirty-five cases operated on by the lateral method, twenty were in children under the age of puberty, and in every case the patient recovered. In males beyond the age of puberty, including a fair proportion of quite old persons, I have had fifteen cases with three deaths, but only one of these three was really the result of the operation. That occured in a case operated on in a neighboring town this winter. Secondary hemorrhage occurred on the ninth or tenth day, and the attempts made by the attending physician to control it were not successful.

I have six cases of the median operation, with one death, to report. In one case the operation was done for the removal of a foreign body, the end of catheter. In this case I succeeded not only in removing the foreign body, on which there was a small calcareous deposit, but also in relieving the chronic retention of urine, from which the patient had long suffered, by tearing off the median lobe of the prostate with the forceps. This was fully ten years ago; the patient is still living, and I believe has not had occasion to use a catheter since. The case which proved fatal was in a patient in the last stages of cystitis and chronic renal disease, and in which the presence of the stone was simply a complication. An interesting feature in this case was that, in addition to the presence of a stone, there was a large quantity of that semi-organized material which has been described by Vandyke Carter as the animal basis of calculi.

I have one case of the supra-pubic operation, in which the stone was a small one, this particular operation being chosen because the case was really one of villous tumor of the bladder, and the presence of the stone was simply a complication. The patient was in a critical condition from hemorrhage at the time of the operation, but made a good recovery.

I have no case of the old-fashioned lithotrity. The operation had already come to be rarely practised before I had occasion to resort to the crushing method. The early portion of my practice was largely with children, and Bigelow's modification had already become the operation of preference when I first felt I had a case adapted to its performance. I have performed this operation eight times, with six satisfactory recoveries and two deaths. Both the deaths were from uræmia, dependent upon chronic disease of the kidney.

I have brought here a number of the calculi which I have removed. The largest weighs three ounces and some drachms. It was removed by the ordinary lateral operation. It was not necessary to enlarge the wound by dividing the right side of the prostate, nor was it necessary to crush the stone. By making a large external wound, by grasping the stone with sufficiently powerful forceps, and by patience in manipulation, this stone was removed without difficulty, and the patient made an excellent convalescence.

The largest number of stones which I have removed from one patient is fifty-four. These were removed by lateral lithotomy. The patient made a good recovery, but returned in a year or so with recurrence of the symptoms from a descent of more stones from the kidney. On that occasion I determined to perform

* Read before Philadelphia Academy of Surgery, Meeting May 1, 1893.

the operation of litholapaxy. The patient did pretty well for a few days, but then the urine became turbid, containing a large quantity of ropy mucus and pus, uræmia developed, and the patient died in convulsions. This was a forcible illustration of the risk attending litholapaxy in cases of cystitis, and since the occurrence of that case I make it a rule, where the patient presents cystitis in an advanced degree, to recommend the cutting rather than the crushing operation.

With regard to the results that I have reached from my own experience, I would say, in the first place, that I have never seen any reason to wish for a better operation than lateral lithototomy in children. Litholapaxy has been resorted to successfully a number of times, and with the improved instruments which we now have the operation is a feasible one, while it could hardly be considered such a few years ago. Until within a short time it has not been possible to get instruments of sufficient strength and delicacy for use in the urethræ and bladders of children. Even now, the operation of litholapaxy in children seems to me to be a more severe one than lithotomy. The results of cutting for stone in children are so satisfactory that I think we want nothing better. The great advantage of litholapaxy, it seems to me, is the short time required for after-treatment. If all goes well, litholapaxy will allow the patient to go about his business in five or six days. This is a great advantage in adults who are engaged in active business; but in young children it is a matter of no importance. At the same time I am willing to admit that the operation has been improved to such an extent that it is one which may be legitimately resorted to in children if the surgeon thinks that it is preferable.

The median operation seems to me to have a very limited field. Cases of foreign body in the bladder, and cases of very small stone, are those to which this operation is adapted. In some of my cases the operation was not begun with the knowledge that a stone was present, but for retention of urine where it was not possible to pass an instrument by the urethra. The argument which has been advanced in favor of this operation, that it is attended with less risk of hemorrhage, does not seem to be entirely well founded. There is very little more risk in the lateral operation. The transverse perineal artery is divided, but with a little care it is not likely that the internal pudic or the artery of the bulb will be injured. In the old days of operation without an anæsthetic, it was quite possible that one of these arteries might be wounded in the struggles of the patient. The artery of the bulb can be avoided by striking the staff as far back as possible. The hemorrhage from which I have had trouble has been from the prostatic plexus of veins, and this is quite as likely to occur in the median as in the lateral operation, and, indeed, I have seen very profuse hemorrhage from this source after median section.

The supra-pubic operation, although just at present the fashionable method, I should reserve for very large stones, or for cases in which there was some complication such as tumor, in addition to the stone. Cases of vesical tumor are more satisfactorily dealt with through the supra-pubic incision, but where the case is an uncomplicated one of stone, I have not seen any reason to prefer this to the lateral method.

In the female, the operation of lithectasy or rapid dilatation is the one to be chosen, and in almost all cases will be sufficient. Mr. Bryant has shown that stones of considerable size can be removed by this method. In children, stones up to half an inch in diameter, and in adults stones up to one inch in diameter, can be thus removed. If the stone is larger, it can be broken into several fragments before removal. I believe that the results of this method will be more satisfactory than if an attempt is made to remove the calculus by litholapaxy or by any form of lithotomy. The vesico-vaginal section may leave a permanent fistula. The high operation may, of course, be required for very large stones.

As regards the operation of lateral lithotomy, the points which are to be observed are, in the first place, to make a large external wound. I have seen very serious trouble result from too small an external incision. There is no objection to a large wound through the skin and superficial fascia; if hemorrhage occurs, it is easier to deal with it through a large wound, and drainage is more satisfactorily effected. In the second place, I think that it is of great importance to strike the staff as far back as possible. Instead of striking it where it is most superficial, I endeavor to

get as far back toward the horizontal portion of the staff as possible. In that way you avoid wounding the artery of the bulb, and obtain plenty of room where it is needed. My preference is to have the staff firmly hooked up under the pubis, instead of having it made to project in the perineum, I believe that in this way it is more firmly held, and that the surgeon can fix the position of the anatomical points better, and therefore cut with more precision. Having struck the staff, I think, following the advice of Sir William Fergusson, that the deep incision should be made small. I believe that there is a decided advantage in this plan. I do not say that the surgeon should not make the wound in some degree proportionate to the size of the calculus, and in cases where there is a large stone, I am in the habit, as I withdraw the knife, of bringing it slightly away from the staff so as to enlarge the deep wound. In children the knife should be withdrawn in close contact with the staff; but in the adult I drop the knife a little, so as to enlarge the wound in the prostate. The finger is then introduced, and the prostrate enlargement completed by dilatation. I do not at all agree with the view of Mr. Teevan, that it is safer to cut the prostate than to stretch it. In the introduction of the finger, I lay stress on its introduction above the curve of the staff. In children this is very important, for if it is not done, the finger may not enter the bladder, but may pass into the recto-vesical space. The surgeon cannot miss the bladder if he passes the finger above the staff, as it is well held up under the pubis.

In my earlier operations I had a great fancy for the scoop in removing calculi, using it as the obstetrician uses the vectis, getting the scoop behind the stone and the finger in front of it, and bringing all out together. Of late years I have used the forceps more and the scoop less, although at times it answers a useful purpose. In the withdrawal of the stone, a mistake that I have often seen made is in not carrying the forceps far enough backward toward the coccyx. The portion of the wound where there is plenty of room is far back. I have seen surgeons try unsuccessfully to remove the stone through the anterior portion of the wound, when it could have been readily removed if the forceps had been dropped toward the back.

In the high operation it is a great advantage to have the bladder and the rectum distented, though, perhaps, not absolutely necessary. There is an advantage, too, in lateral lithotomy, in having a moderate quantity of fluid, say about four ounces, in the bladder before the operation, as the gush of water, when the bladder is opened, will bring the stone down on the end of the finger. If, however, the bladder is intolerant, I do not care to have it much distended.

With regard to the operation of litholapaxy, the points which I consider to be of importance, are, in the first place, to crush the stone as thoroughly as can be done, and then, when using the evacuator, to make the stream enter with great gentleness. I believe that cystitis may be aggravated or even caused by using to much force. As regards the rapidity of the operation of litholapaxy, I have no doubt that an operator will do it with greater rapidity as he does it oftener, but for my own part, I have found it a slow operation. I think that no surgeon should undertake it who is not prepared to give as many hours to it as may be necessary. I can recall three cases in the practice of other surgeons in which the patients died as the direct result of having a stone left half crushed in the bladder. Violent cystitis came on and the patients succumbed. Where the operation is undertaken, it should be completed. If the surgeon is not prepared to remove the entire stone at one sitting, he should not undertake the operation at all. This is the operation for small stones in patients with healthy bladders. Cystitis is the most dangerous condition in which to resort to litholapaxy. In the case of an adult presenting himself with stone, my first thought is of litholapaxy. I then consider the various circumstances in the case. Litholapaxy has so many advantages in cases to which it is adapted, that I think it should be the surgeon's first choice.

With regard to the objection that lateral lithotomy may render the patient sterile, I do not see why that should be, provided that the operation is confined to one side of the perineum, and that no undue amount of inflammation follows. If there were a great deal of inflammation, it is quite possible that there might be such obstruction of the vas deferens as to prevent the

patient from generating with the testis of that side, but there is no more reason why the patient should be rendered sterile by the operation of lateral lithotomy than by the removal of one testicle. In the immense number of operations performed in former years, we never heard of this objection and I believe that it is rather theoretical than practical.

I have had one case of stone weighing less than two grains, which I diagnosed by the sound, and removed by lateral lithotomy. The patient was a lad who had the symptoms of stone in the bladder, and in addition, frequent attacks of sudden and complete retention of urine, due to the calculus entering and pluging the internal meatus. The straining was so excessive that, in the effort to pass water the night before the operation, the patient ruptured sub-conjunctival vessels in both eyes.

I wish to refer to a few cases of cystotomy for other causes than calculus. I do not include cases where I have operated by Sir Henry Thompson's method of puncturing a contracted bladder above the pubis. I find that I have opened the bladder by cystotomy in eight cases, six of these being cases of cystitis. Of these six, four recovered, and two died, as the result of the diseased state of the urinary organs. In two instances I have opened the bladder for intense pain in the act of micturition, due to a fissure at the neck of the organ. Both patients recovered. In one case the fissure followed cystitis, the result of gonorrhœa, and in the other case, the symptons came on after the use of very large sounds.

I have had one case of cystotomy in a child for tuberculous disease of the bladder. This case was of a good deal of interest. The patient had at one time, been under the care of the late Professor S. D. Gross, who had sounded the child, and said that he felt a stone. It is to be observed, however, that he never appointed a time to operate, so that it is possible that he may have had some doubts as to the diagnosis. A curious feature of the case was that the father, who was a man of considerable intelligence, declared that he had himself distinctly heard the click of the stone against the instrument. I sounded the child, but was not entirely satisfied that a calculus was present, although, from the history, I thought it probable. The child had all the usual symptoms of stone, except sudden arrest of the urine. I asked Dr. Forbes to see the case with me, and we thought it right to open the bladder. No stone was found, but there were discharged twenty or thirty little bodies which I presume were what the older surgeons would have spoken of as fibrinous calculi. They looked like little pieces of cat-gut. Whether these were masses of tuberculous material, or of inspissated mucus and lymph, I do not know. The patient was relieved of his symptoms, but died two months afterward of tuberculous disease of the mesenteric glands.

A CASE OF DIPHTHERITIC CROUP IN WHICH A TRACHEOTOMY-TUBE WAS WORN FOR SIXTY DAYS.*

H. R. WHARTON, M. D.

On December 20, 1892, I saw a child eighteen months of age, who was suffering from diphtheria, who exhibited marked symptoms of dyspnœa. I introduced an intubation tube which relieved the dyspnœa, but at the end of fifteen hours this was coughed up, and I was summoned to see the case again, and found that the dyspnœa had returned. I then performed tracheotomy, and after the operation the dyspnœa was entirely relieved, and the patient subsequently did well.

On the tenth day after the operation the tracheotomy-tube was removed and the patient breathed comfortably, but in fifteen or twenty minutes after the removal of the tube the dyspnœa rapidly recurred and became so urgent that I had to replace the tracheotomy-tube.

Attempts were again made to remove the tube at intervals of a day or two for a week or more with a similar result. Four

* Read before Philadelphia Academy of Surgery, May 1st, 1893.

weeks after the operation the child was etherized and the tracheotomy wound was dilated, so as to expose the wound in the trachea. It was then found that there were a number of masses of granulation tissue springing from the trachea in the region of the tracheal incision; these were removed with forceps and scissors, and the tracheotomy-tube was again introduced. After waiting a few days another attempt was made to remove the tracheotomy-tube, but this also failed. An intubation-tube was introduced upon the removal of the tracheotomy-tube, and was worn for some hours, and upon its removal the child was able to breathe comfortably for five hours; but after this time dyspnœa recurred, and the tracheotomy-tube was again introduced. After several trials of the intubation-tube, it was finally abandoned, and it was decided again to etherize the patient and examine the tracheal wound, fearing the granulations had recurred. The patient was etherized and the tracheotomy wound was enlarged so as to expose the tracheal wound, and it was found that a number of masses of granulation tissue were present; these were removed with forceps and scissors, and their bases were touched with the solid stick of nitrate of silver. An intubation-tube was then introduced, and it was worn for twelve hours, when it was coughed up. Thinking its expulsion was probably due to the irritable condition of the larynx and trachea, resulting from the recent operation, I waited forty-eight hours and then replaced the intubation-tube. To keep the tracheotomy wound open, so that the tracheotomy-tube could be introduced, if it were required, I introduced an obturator into the tracheotomy wound. The intubation-tube was worn for four days and was then removed, and the obturator was retained in the tracheotomy wound for three days longer, and was then removed. The child after this time had no further difficulty with his breathing, and the tracheotomy wound, after the removal of the obturator, rapidly contracted and healed. The patient wore the tracheotomy-tube for a period of sixty days.

A case of intubation of the larynx, in which the tube was worn for fifteen days.—On February 24, 1893, I saw, with Dr. H. M. Fisher, an Italian child less than two years of age, suffering from marked dyspnœa, which had come on gradually in the previous forty-eight hours. I introduced an intubation-tube in this case, which completely relieved the dyspnœa, but it was coughed up in twenty-four hours, and the next larger tube was introduced. On the third day, the tube was removed and the child breathed comfortably for half an hour, but after this time the dyspnœa gradually returned and the tube had to be reinserted. Another attempt was made on the sixth day, and the tube was kept out for three hours, and after this time the dyspnœa recurred and I was compelled to reintroduce the tube. Attempts to remove the tube were made at intervals of two days, with a like result, and it was only on the fifteenth day that the tube was permanently removed.

In this case I noticed in each removal of the tube that there was little expectoration of mucous or membrane and that the cough was croupy, and it was observed that at the time of the final removal of the tube that the cough was loose.

In all acute cases the patient is usually able to dispense with the intubation-tube in from five to eight days; this case wore the tube for fifteen-days, the longest period in my experience that an intubation-tube has been required.

Two cases of excision of the hip-joint for Coxalgia.—I. Harry O'Neill, aged seven years, was admitted to the Children's Hospital April 27, 1892, having suffered from coxalgia for two years, and been under treatment in three different hospitals before he was sent to the Children's Hospital. When he came under my care there was a sinus on the outer aspect of the thigh which had been made for drainage, upon the anterior surface of the thigh over the hip-joint.

On July 5, 1893, as the patient had suffered some time with a high temperature, and as he was rapidly loosing ground I decided to excise the hip-joint, and upon exposing the joint I found the head of the femur separated and represented by a small irregular sequestrum, and the neck of the femur had undergone marked absorption, the acetabulum was roughened but not perforated. The patient did well after the operation; the wound healed promptly and he was sent to the country branch in two or three weeks after the operation.

I show the patient, ten months after the excision of hip-joint, and you see he has a very firmly healed wound and a very good range of motion at the false joint; his general condition is also excellent.

II.—Charles G., aged eleven years, suffered from coxalgia when eight years of age, was treated at the Children's Hospital as an out- and in-patient for several years, and finally his condition became so bad by reason of the free discharge from sinus in connection with the hip-joint, and from his continued high temperature, that excision of the hip-joint was decided upon. The joint was excised in June, 1891, and the patient had a slow convalescence, but finally the wound healed, and the patient's general condition improved.

I show him to-night, nearly two years after the operation, and you see that he has a remarkably free range of motion at the false joint, and his general condition is excellent.

Specimen of fracture of the right femur, showing the condition of the bone eighteen days after the injury, from an infant eihtg months old.—Emily S., eight months old, was admitted to the Children's Hospital, June 18, 1892, having sustained an injury of the right femur from a fall ten days before admission. Examination showed that there was a fracture of the shaft of the right femur. The child was suffering from enterocolitis at the time of admission, and was quite sick; the fracture was dressed with a moulded binder's board splint. The patient grew gradually worse, and six days after admision developed a temperature of 107° and died. Examination of the specimen shows marked overlaping of the fragments at the seat of fracture, the shortening being at least one inch.

This specimen is of interest, as it shows that contrary to the generally accepted teachings that there is little shortening in fractures of the femur; in infants, that marked overlapping of the fragments may occur, giving rise to very considerable shortening.

SUTURE OF TENDONS.

DR. JOHN B. CRANDALL, Sterling, Illinois.

M. L., a mechanic; married; aged 51 years; in general good health, with the exception of atrophy of the left shoulder from an old injury, (for which he is at present drawing a pension) and subjective symptoms of old rheumatic lesions of some of the larger joints—says his flesh never healed readily.

On December 15th, 1892, the patient received an injury to the right hand by getting it caught in a "shaper," cutting a gash some 2½ inches long diagonally across the back, completely severing the tendons of the extensor indicis muscle as well as the tendon to the index finger from the extensor communis digitorum.

The hand was covered with mechanic's oil and blacking. With brush, soap and hot water we made the surrounding parts as nearly aseptic as possible, washing out the wound with a solution of bichloride of mercury. The proximal ends of the divided tendons were retracted, their sheaths more or less torn, wnile the power to extend the middle finger was lost.

The ends of the tendons were caught with artery forceps, approximated and retained in position by sutures of catgut which had been preserved in oil of juniper. I found that it required a great deal of nicety to properly adjust the ends of the tendons as they were cut diagonally across, but that difficulty was remedied by having the suture follow the line of the incision. The sutures were buried, as good a covering as possible made for the sheath, and the external wound closed with silk sutures. The dressing consisted of several thicknesses of iodoform gauze covering the dorsum of the hand with a retaining splint upon the palmar surface.

I was called out of the state and did not see the case for three days. On the second day after the injury, he had some pain but would not allow my assistant to dress the wound. When it was redressed on the third day, I found more or less œdema of the hand with some pus formation at the seat of the wound. A small amount of pus could be pressed out from along the

tract of the tendon of the middle finger. As the sheaths of all the extensor tendons were either bruised or torn; I injected Marchand's peroxide of hydrogen and removed all of the pus within reach.

After this dressing, the patient kept about his work, coming to my office every second day to have his hand redressed. During the third week he was taken with a chill, following exposure to the cold. The hand and arm was very much swollen with an erysipelatous flush covering the whole forearm and the inside of the arm to the axilla. Removing the splint, I enveloped the whole arm in a wet dressing composed of a solution of borax and boracic acid. He was confined to the house for two weeks or more, the inflammation gradually being reduced by the use of the wet dressing. While the solution used was of much benefit, I cannot help thinking that probably hot water alone would have given the same result.

At present the case has exceeded my expectations; the tendons have united in good form and he has control over the tendons of the extensor communis digitorum as well as the use of the tendon of the index finger alone.

The remarkable feature of the case is that we should get such a good result after having so much inflammation and general disturbance of the system—all of which could have been avoided if the patient had kept away from his shop and taken better care of himself from the start. It goes to show that tendons will unite if the proper attention be given them.

LIFE INSURANCE AND ITS RELATIONS TO U. S. PENSIONERS.

A. O. STIMPSON, M. D., Thompson, Pa.

Studium immane loquendi, has given rise to the frequent enunciation of an old aphorism, viz: "There are tricks in all trades but mine." Unfortunately, the application to our honorable profession would seem to be incongruous if we are to follow out closely the individual actions and characteristics of its members. When we see men prostituing their talents and abilities for the unworthy purpose of securing pensions for men who are in no way dependent upon, nor deserving of them, it certainly behooves some honest member of the guild to deprecate and expose the evil.

For the past fifteen or eighteen years I have had frequent occasion to furnish evidence in the furtherance of such claims and in many instances I must say that the request was worded in such a way as to make it seem a personal insult. In many instances the evidence sought for was just and all right, as the claimants were, at the time the application was made, suffering from both direct and remote effects of wounds and diseases contracted while in military service; but on the other hand there are a class of old soldiers that were undeserving of pensions, since they went into the service voluntarily for the sake of the big bounties the Government were paying for substitutes, because they courted the honor and notariety that the position of a soldier would give them among their fellows, and also because they stood a chance of promotion in the ranks. Of the *worthy* class of soldiers we have nothing to say; but the *unworthy class* are the ones that are most importunate and unreasonable in their demands for services rendered.

I have known of men who enlisted for three months service, with the payment of a big bounty as an incentive, clamor for fifteen or eighteen dollars per month pension as if it were deserved, when they had not a single wound to show as a mark of service and oftentimes were not even engaged in active service.

There are many old soldiers living today that are fully entitled to all that they receive and in many cases do not draw pensions adequate to their disabilities and wounds. On the other hand, many undeserving ones are receiving big monthly pensions where they do not deserve any.

Those whose decreptitude and infirmities result from age and the vicissitudes of life, from careless exposure, etc., ought not to be recognized as worthy pensioners.

How have these unjust claims been substantiated? By fraud and speculations of pension agents, and by manufactured evidence furnished by unscrupulous medical examiners for the sake of the few dollars paid them by the applicant.

I know of men to-day who are considered wealthy, loaning money at various rates; who clamor for pensions of eighteen and twenty dollars per month, who have not a wound or single physical disability that they can conscientiously claim was caused by wounds or privations while in the U. S. service. Why were such claims allowed? Political influence and social standing were the substitantiating causes of their claims being allowed. I am frequently called upon to examine U. S. pensioners for life insurance. Does it not seem incongruous to have such a subject written down as a first or second class risk, yet on careful and conscientious examination you cannot consistently refuse to accept him as a perfectly safe risk. Now the question arises, how did he establish his claim for an invalid pension unless through fraud. Either his pension examiner was remiss in his duty in furnishing him with an affidavit as an invalid pensioner, or the life insurance medical examiner was a charlatan in passing him as a worthy policy holder. Can an invalid soldier become a bona fide life insurance policy holder? Certainly not. The two conditions and requirements are incompatible. Yet I am sorry to say that the number of such cases are not few. Either the pension examiner is over zealous in the interests of the soldier, or the life insurance medical examiner in his profession. Life insurance companies cannot be too careful in their selection of medical examiners and on the other hand, the pension department, should not be so willing to accept of evidence of disability, promiscuously from any one who writes M. D. after his name.

Let us hear from other members of the fraternity on this subject as I do not consider it by any means complete or exhausted.

CLINICAL OBSERVATIONS IN NEW YORK.

W. H. LINK, Petersburgh, Ind.

Dr. Jno. A. Wyeth, of the Polyclinic is one of New York's great surgeons. He is doing some very excellent work in the plastic surgery of the face and nose. He has lately done his second successful bowel resection. Lateral, or end to end anastomosis finds no favor with him. Circular enterorrophy by means of the C. Zerny and Lembert suture is the method relied upon. In the radical cure of hernia he bosses the sac just at the entrance of the internal ring after the method of McEwen and he treats the canal after the method of Bossini, thus combining the excellent features of each. Antisepsis has a strong hold on him yet, and while he does not forget to be antiseptic, he yet relies upon the protective influence of chemical germicides, and of these bichlorides is his preference.

Dr. Wyeth is a graceful, cool and thorough operator and his results place his qualities as a surgeon in an enviable light. He is a splendid example of the Cosmopolitan character of New York City. A southern man by birth and education, he boldly swung out his sign in New York and has achieved a phenomenal success. A success which does not always follow because one has merit. New York is filled with successful men from the south. Thomas, Emmet, Bozeman, Wyeth, Wylie, Polk, and a number of others are all from the south-land. It would seem that the idea that only inhabitants of the north are blessed with energy has a poor foundation, at least in medicine; for it is only the possession and exhibition of the most heroic energy, coupled with marked ability, that crowns with success the efforts of any man in a great city like New York.

Dr. Wyeth's kindness to visiting physicians is something long to be remembered. He appears to bear the advance of time quite cheerfully and no one would suspect him to be growing old by either his appearance or his manner.

The only thing in Wyeth that a Hoosier does not like is he still thinks his Camp Morton stories, as published in the *Century*, are true.

Thomas H. Manley is another surgeon of N. Y. who is rapidly coming to the surface. Like most successful men he was born and reared in the country. Tiring of Massachusetts, he came to the Metropolis and both as an operator and writer he is regarded very favorably by the profession.

He has lately done some valuable work in compound fractures and urethral surgery and has now in the printer's hands a work on hernia that will, no doubt, be a welcome addition to the few distinct treatises on that subject. Dr. Manley's book goes deeply into the history of hernia and he shows that almost every operation device or instrument for the cure of this condition was discovered and applied by the ancients, who were likewise fully up in the anatomy and pathology.

Dr. Manley is a small, delicate man of about 250 pounds weight and is as jolly and wholesouled as his proportions would indicate. He is a fine operator and takes great pleasure in showing his work at the Harlem Hospital, to which he is a visiting surgeon. Dr. Manley is a strong advocate of asepsis and carefully exemplifies its underlying principles in his work, but he thinks the day of germicides is past and that in another decade the complicated system of antiseptics will give way to the simplicity of asepsis.

Dr. V. P. Gibney, who is surgeon in charge of the Hospital for Ruptured and Crippled, is another of New York's great men. He is certainly a master in orthopædics and the little children at the hospital under his care appear to fairly idolize him. He treats abscesses due to hip-joint disease, by simple aspiration. His results are excellent.

He has lately devised a new treatment for sprains of the ankle joint. It consists in putting on a scultetus bandage of rubber-plaster so as to fortify the injured joint and then permitting or ordering the patient to walk. In old sprains of this joint he breaks up adhesions under ether and then treats it as an acute injury. By this means he promotes absorption of exudates and cures the patient.

New York is certainly a great field for general surgery and he who is looking for clinical observation in that line can not find its equal in America. The number of first-class operators, who are constantly operating, is so numerous that one can not, for lack of time, avail himself of half his opportunities. The excellence of the work done is unequaled anywhere and every man vies with his friends in showing his work.

LEPTOTHRIX MYCOSIS OF THE TONSIL, PHARYNX AND BASE OF TONGUE, WITH REPORT OF THREE CASES.*

WM. CHEATHAM, M. D., † Louisville Ky.

B. Frankel, of Berlin, in 1873 pointed out the presence of Leptothrix threads in an affection of the tonsils, base of tongue etc., which had before been known as follicular inflammation of these parts. Some authors have since gone so far as to say that they are one and the same diseases ; that they all contain the leptothrix threads. I feel assured there are two entirely different diseases ; that the presence of follicular tonsillitis, makes one more liable to have mycosis of the part as leptothrix threads are present in most of our mouths most of the time. In follicular diseases of the tonsils, there is more constitutional disturbance ; the contents of the lacunæ is yellow and easily detatched. The microscope shows the absence of the leptothrix threads. The deposits are scarcely ever above the level of the tonsil surface. I have taken a syringe in a case of chronic follicular tonsillitis, passed the tip into one of the openings in the tonsil and washed out dozens of small lumps of secretion, which have a disagreeable odor. These deposits are within the lacunæ and

*Medico-Chirurgical Society of Louisville, April 7th, 1893

† Professor of Diseases of the Eye, Ear, Throat and Nose, Louisville Medical College.

the tonsils are usually enlarged ; the disease is curable ; in many cases it responds to treatment readily. These symtoms do not hold good in all cases.

In mycosis leptothricia of the tonsils, the tonsils are usually small ; usually so small you cannot get hold of them with a tonsillitome to remove them : there is no constitutional disturbance ; no bad odor ; patient complains of foreign bodies, such as hair, fish bones and splinters of tooth picks being in their throats. The deposits are white or yellowish-white, most always very difficult to detach ; frequently cannot be even curetted away. Have to, in a majority of cases, be torn off with forceps ; are elevated above the surface of the tonsils ; sometimes pedunculated ; often look like small spurs ; are frequently located not in the crypts but away from them ; may be on the pillars of the fauces. The microscope shows numerous leptothrix threads present. Jaksch says, "These threads are long bacilli, usually segmented and arranged in large ribbon-like bundles ; they stain bluish-red in iodine-potassic—iodide solution ; shorter bacilli are sometimes present, which do not stain."

O. Chiari, says he considers it a modification of follicular angina, and that yellowish plugs which do not contain leptothrix are often found in the crypts of the tonsils. Ingalls in his late work on "Diseases of the Chest, Throat and Nasal Cavity" page 369, says "mycosis of the throat, characterized by yellowish-white deposits resembling in some cases those of follicular tonsillitis." It will be opserved that Dr. Ingalls believes in the duality of the affection. On pages 370 and 371 he gives side by side the points in the differentation of the two affections. In the "*New York Medical Journal*" of December 3,1892, Dr. F. I. Knight, of Boston, publishes a paper on this subject, that he read before the "American Laryngological Association." This same journal also contains a discussion of the paper by Drs. Delaney, De Blois, Johnston, Mulhall and others. Wright, Mulhall, Beverly, Robinson and Langmaid, in fact a majority of those present appeared to believe in the duality of the affection ; the others gave no opinion on this point.

Dr. Knight says in his article that "In the April, 1882, number of the *Archives of Laryngology* Dr. Emil Gruening, of New York, published an article (without any allusion to the previous publications of Frankel) which began thus : "While the constant presence of leptothrix elements in the mucus of the mouth and the frequent occurence of concretions in the tonsillar crypts are facts with which every medical man is conversant, the relation existing between leptothrix buccalis and the formation of tonsillar concretions does not seem to have been recognized even by the throat specialist." From an examination of fifty cases, Gruening advanced the proposition that all tonsillar concretions were composed of leptothrix elements, and that the calcification of these masses might be induced by the presence of the alga leptothrix, just as the presence of certain non-parasitic algæ in liquids containing salts of calcium in solution induces precipitation of the calcium in the form of carbonate. He further says that "the presence of these concretions in tonsillar crypts and carious teeth is merely a substantiation of the more general fact that leptothrix concretions will form in all these normal and pathological recesses of the mouth and pharynx which are not reached by the ordinary process of cleansing, remain undisturbed by any mechanical action during the process of mastication and deglutition, and are devoid of any secretory *Vis a Tergo* sufficiently potent to dislodge the parasite."

"This is a strong statement of the case by one of those who believe that the parasite is the *Fons et origo malis*"

"It would, however, seem reasonable to classify those cases in which the growth has become excessive, and is rapidly reproduced again and again on removal, as cases of mycosis, whatever the exact mode of origin, and although it is difficult, as stated by Newcomb, to say just where the process ceases to be a natural accident and becomes a pathological entity, the typical cases of tough, adherent, spear-like, projecting masses can be set down as cases of mycosis, but the less marked cases will be hard to classify."

I have just seen a most typical case of so called chronic follicular tonsillitis, with deposits on the base of the tongue, also with no leptothrix threads.

Four or five years ago, I had under my observation two healthy school girls, with

tonsils very small, in fact almost no tonsils at all. Yet what remained of them was studded with hook like deposits of leptothrix. These deposits were not only on the tonsils but over the base of the tongue, the pharynx and the faucial pillars ; the curette was used, and all kinds of applications made, with a rapid return of the deposits. Both cases were finally relieved by stopping all sweets, and giving the alimentary tract the correct attention.

March 3rd, Mrs. R. was sent to me by two Indiana physicians. She had had for several years an affection of the throat. Her family being tuberculous, her friends and physicians were much alarmed concerning her. She presented a most typical leptothrix mycosis of pharynx, faucial pillars, tonsils and base of tongue. Those on the base of the tongue were flatter and larger than those on the other parts Plate xxxvi, in Dr. Robert Krieg's Atlas of Diseases of the throat, etc., gives a splennid picture of the disease as seen in Mrs. R's case. I had considerable difficulty in getting enough of the deposit off, as it was so adherent, for a mount for the microscope ; the microscope showed the threads of the leptothrix to be very plentiful. Mrs. R's throat at times gives her no trouble, as the disease occasionally gets well of itself, to return again in weeks, months or years.

Leptothrix Mycosis of the throat is very difficult to cure. The teeth should be investigated, for there you may find a nidus for the parasite. This is said to assist in the production of tartar and decay of the teeth. The deposits should be removed if possible by forceps, or the curette, or still better a galvano-cautery point should be inserted into each deposit, applying it to several each day, and making the applications not to close together. This treatment is slow, painful and tedious, Cocaine will of course correct the second. This treatment gives the best results. Again, all food (such as sweets) which are liable to ferment in the alimentary canal should be stopped, and the canal kept as aseptic as possible. Sometimes the disease dissappears, as I stated before, without treatment, again no treatment does any good, then again calomel internally with the alkalies,and salol and naptholine may make a cure, but when you come across a genuine case of mycosis leptothrix pharyngea, do not make any promise of permanent relief. They may hang on for years, and pass from physician to physician, yet got no benefit.

SOCIETY REPORTS.

AMERICAN MEDICAL ASSOCIATION.*

SECTION ON OBSTETRICS AND DISEASES OF WOMEN.

June 6th, First Session.

Dr. J. M. Duff, Pittsburgh, Pa., Chairman.

Dr. M. B. Ward, Kansas, Secretary.

First in order was the Address of the Chairman. Dr. Duff selected for his subject "Some General Reference to Obstetrical and Gynecological Advancement."

He said the large number of papers offered from all parts of the country, from men of the highest standing in the profession was significant of the general zeal and the welfare of the American Medical Association. He referred to the duty of the Chairman, the object of meeting, the work of the past year, new recruits, educational advantages, our literature, etc.

Regarding operative work, the solicitude of many with reference to the operative mania which had taken possession of the profession during the past few years, was not without cause. No one would have the temerity to deny that there had been, and yet is at the hands of some, too much indiscriminate, useless and oft-times reckless abdominal, gynecic and obstetric sur-

gery. The past year had witnessed a great improvement in this direction.

Cancer of the Uterus.—Few diseases were more prevalent than cancer of the uterus and none was formerly more universally fatal. There was now a very general consensus of opinion that the disease was of local origin, and not, as formerly supposed, a general disease with a local manifestation. In 474 hysterectomies at the hands of five different operators, there was a primary mortality of only 8.4 per cent. At the end of two years, in 56.25 per cent. of eighty-two vaginal hysterectomies done by Leopold, the patients were living without a recurrence of the disease.

The gynecological treatment of the insane was one of the live topics during the year. The intimate relationship existing between the brain and generative organs would rationally lead us to infer that in women predisposed to insanity, disease of the latter might be an exciting, if not a direct cause of mental alienation in some cases. Absolute proof could be found in the results of a number of operative procedures undertaken, only after the most painstaking investigation, by Joseph Price, Alice Bennett, W. P. Manton, J. B. Murdoch, Geo. H. Rohe, C. C. Hersman, and a number of others.

Dr. Duff then dwelt upon pubeotomy, criminal abortions, placenta previa, and puerperal infection.

Dr. Charles P. Noble, of Philadelphia, read a paper entitled The Causes of Diseases of Women.

He called attention to the fact that within recent years the thoughts of gynecologists had been largely occupied with the study of the pathology and treatment of tubo-ovarian disease, and that as a consequence very little had been said in a systematic way concerning the causes of the diseases in women. The object of the paper was to present a brief outline of the nature of the causes of diseases in women, and to point out the fact that these causes were largely of a preventable nature. The principal causes of the diseases of women were: (1) imperfect development of the sexual organs; (2) gonorrhœa; (3) septic inflammation following child-birth; (4) lacerations due to child-birth; (5) miscellaneous causes, including constipation, erronous habits of life and errors of dress. The above causes were then expatiated upon *seriatim*.

Dr. Howard A. Kelly, of Baltimore, called attention to the great importance of tuberculosis of the female genitalia. Many of the cases that came under his observation were tubercular in character. He should say that at least five per cent. of the cases of inflammatory diseases upon which he operated were tubercular.

Dr. Henry P. Newman, of Chicago, said prophylaxis would have its day. It was comparatively easy to institute prophylactic measures that would prevent a very large per cent. of the diseases now prevalent among women.

Dr. E. P. Davis, of Philadelphia, directed attention to neuralgias, not only those dependent upon malnutrition or anemia, but more particularly those of the pelvic viscera.

Dr. Joseph Price, of Philadelphia, was satisfied that of menstrual disorders, many begin in infancy; and that vulvar and vaginal discharges of infants were neglected. It was exceptional for the physician to treat these conditions in the infant. Some of the infantile conditions were over-treated, and many young women would conceive and bear children if let alone in the first place.

Dr. Reed, of Ohio, said deranged or vicious menstruation grew of imperfectly developed sexual organs. The most difficult cases he had to manage were those in which both the uterus and other organs were undeveloped.

Dr. Henry J. Carstens, of Detroit, could not entertain the opinion that gonorrhœa was the cause of nearly all the diseases in women. The habit of women inducing abortion was an etiological factor of paramount importance.

Dr. Hoff, of Ohio, entered his protest against the charge of so many young girls having gonorrhœa. While this might be so in Philadelphia, it would not hold good in Ohio.

Dr. Joseph Hoffman, of Philadelphia, called attention to affections of the bladder incidental to parturition, and also to the pre-puerperal state as brought on by constipation and by dislocation of the uterus, etc. He thought many of the troubles with which women were afflicted, such as displacement, retroflexion, subinvolution, etc., could be avoided by insisting that more women remain in bed for two weeks after child-bearing.

Dr. E. H. N. Sell, of New York City, cited families in which the younger members, boys and girls, had gonorrhœa. In one case the disease traveled and involved both bladder and kidney.

Dr. L. S. McMurtry, of Louisville, said intra-pelvic inflammations were sometimes the result of forcible dilatation of the cervix. He was perfectly satisfied that a great many cases of tubo-ovarian disease were the result of habitual and routine use of caustics upon the cervix uteri.

Dr. James P. Kerr, of Pittsburg, followed pith a paper on *Puerperal Hemorhage.*

There was no class of cases which required more prompt action and wise judgment than that of puerperal hemorrhage. After dwelling at length upon the causes, the author said that every case should be treated as one by itself, and as though hemorrhage was impending. Attention should be directed to securing tonic contractions and retractions of the uterus as a prophylactic. This was done by carefully following the uterus down with the hand when the child was expelled; also by making pressure over the fundus and by external manipulations. If the uterus was soft and flabby give some of the preparations of ergot, preferably ergotine by hypodermic injection. Misrachi claims that caffein acts more readily than ergotine if the patient has lost much blood. Bossi considers hydrastis canadensis a very useful remedy in the treatment of hemorrhage, both during pregnancy and after parturition; administers it to patients with a predisposition to flooding and claims excellent results. Murray advocated plugging the vagina where the os was dilated. Dr. Kerr did not think this was good practice. The mode of treatment recommended by Kochs he considered novel. It consists in inverting the uterus, and putting an India rubber band around the neck of the inverted organ; at the end of six hours the band is removed and the uterus replaced.

JUNE 7TH—SECOND DAY—MORNING SESSION.

The first paper read was by Dr. T. Ridgeway Barker, of Philadelphia, entitled

THE ROUTINE PRACTICE OF ADMINISTERING ERGOT AFTER THE THIRD STAGE OF LABOR.

To summarize the advantages derived from the routine employment of ergot after labor, he said one was justified in stating that

1. It ensures the woman against possible uterine relaxation.

2. It causes a reduction in the size of the uterus, which consequently encroaches less upon the pelvic viscera.

3. The vessels in the uterine muscular walls are depleted and the force of the blood current reduced.

4. It secures permanent closure of the uterine sinuses and allows the formation of firm clots at the mouths of the lacerated vessels.

5. It reduces the area of the denuded placental site, thereby lessening the danger of the entrance of septic matter into the circulation.

6. It materially and markedly diminishes the size of the uterine cavity with the resultant expulsion of all *débris.*

7. It shortens the duration of after pains, and renders the occurrence of fermentative changes within the cavity impossible.

8. It hastens and facilitates the physiological processes incident to involution.

9. The tablet triturate form of administration is to be preferred, since it is rarely attended with nausea or vomiting.

10. That it never does any harm in suitable doses and is always productive of good.

Quite the contrary he belives to be the case, and has so placed himself on record, when ergot is prescribed during any of the three stages of labor. It is then a dangerous remedy and one likely to do far greater injury than any fancied good.

Dr. Geo. I. McKelway, of Philadelphia, followed with a paper entitled

REPEATED EXTRA-UTERINE PREGNANCY WITH THE REPORT OF A CASE.

After describing the case in detail, and mentioning cases that had come under the observation of others, the doctor took the position that in all cases in which upon operation a tubal pregnancy was found, the ovaries and tubes of both sides should invariably be removed.

Dr. Henry J. Carstens, of Detroit, read a short paper entitled

PORRO VERSUS CÆSAREAN SECTION.

The author had reported a successful Porro operation last year, and said it was

peculiar that he should be able to report another case within six months. The second case was in brief as follows:

Mrs. S., aged 23. In the fall of 1891, he was called by Dr. W. J. Brand to help him deliver her. She had been under the care of a midwife for twenty-four hours when he was called and failed to deliver her with forceps. As the child was dead, the only thing to do was to perform craniotomy. Even after craniotomy it was quite difficult to deliver on account of the narrowness of the pelvis. When this was finally accomplished, he took careful internal measurement with the pelvimeter and found an antero-posterior diameter of less than three inches. She made a slow, but good recovery. She was told that if she ever became pregnant again that it would be necessary to bring on premature labor. Patient was anxious to have a child and did not think that a seven months child would live, although told of the danger and need of Cæsarean section if she went to full term. She again became pregnant and only told Dr. Brand two weeks before her expected time. It was decided to operate at once. Patient was prepared for an abdominal section. The bag of water was first ruptured and then the usual incision was made. The uterus was rolled out á la Muller, an elastic ligature applied, then the uterus quickly opened and a child weighing eight pounds removed. Dr. Carstens was undecided to do a Porro, but all the other physicians present were unanimous for it, hence he applied a clamp. He removed the uterus, tubes and ovaries. The after-treatment was like any other cœliotomy, and her recovery smooth. She nursed her child from the first and left the hospital twenty-five days after the operation. At present she is the picture of health.

Dr. Giles S. Mitchell, of Cincinnati, reported a

SUCCESSFUL CASE OF CÆSAREAN SECTION.

The patient was twenty-four years of age, primipara, rather delicate and of a highly nervous temperament. The abdominal incision was eight inches in length, two-thirds of it being above the umbilicus. There was very little bleeding from the abdominal parietes. As soon as the uterus was exposed a loop of rubber tubing was slipped over the fundus and brought down to the neck. The uterus was then quickly opened, the incision being about six inches in length, through the fundal and middle zones. Delivery was speedily accomplished by means of the feet. The child, a male weighing seven and one-half pounds, was asphyxiated, but Dr. Reed soon succeeded in resuscitating it. The stitches were removed on the seventh day after operation, union having taken place by first intention along the entire wound. On the tenth day, the patient was well from a surgical standpoint.

SECOND DAY—AFTERNOON SESSION.

Dr. J. N. Martin, of Ann Arbor, Mich., read a paper entitled

METHODS OF REMOVING THE UTERUS FOR UTERINE FIBROIDS, WITH REPORTS OF CASES.

Dr. Joseph Price, of Philadelphia, contributed a paper on

METHODS AND MATERIALS IN ABDOMINAL AND PELVIC SURGERY.

He said, in gynecology much of the early work was experimental in character. Methods were tried and abandoned, and then again revived as new and original.

Regarding vaginal hysterectomy for diseased appendages, he said the present procedure was an imperfect one and dangerous in the hands of any one, no matter what their surgical experience and skill. The adhesions omental and intestinal, commonly found in the removal of all adherent forms of disease, must be dealt with from above. The removal of the uterus was a simple matter, but dealing with complications above required painstaking surgery to save the patients and to relieve them from primary and secondary complications, which were always serious. In cases of peritonitis, whether due to infection through veins, lymph channels, perforating ulcers, suppurating appendicitis or dermoids, the treatment should be prompt, radical and thorough. Seek the cause. The abdomen once opened, there should be no hesitation in removing it, whether it be appendix, dermoids, suppurating tubes, or a section of intestine. All operators should have an accurate knowledge of their materials. Only imperfect work can

follow the use of large coarse silk. Accidents, hemorrhage, abscesses, fistulæ, and a variety of post-operative sequelæ follow its use, as they do also the use of bad qualities of cat-gut. Pure, fine silk, well placed, is rarely followed by any trouble.

THURSDAY, JUNE 8,—MORNING SESSION.

The Section was called to order by the Chairman at 9 o'clock.

The first paper read was by Dr. Henry O. Marcy, of Boston, entitled

VENTRAL HERNIA FOLLOWING LAPAROTOMY, ITS CAUSE AND MEANS OF PREVENTION.

The author said that laparotomy from a great variety of causes was now becoming so frequent that any method of improvement in its technique, or results, became of much greater importance than formerly. The attention of surgeons to the more essential factors of the operative procedures within the abdomen had very naturally caused the parietal wound to assume minor consideration, and, as too often treated by even practical surgeons, seemed to be looked upon as a trivial matter. However, it was admitted that about ten per cent. of all laparotomies resulted in ventral hernia, and in order to lessen or prevent this, it was quite the standard rule to apply a lacing abdominal support to be worn for months. During the last eight years the speaker had employed exclusively the buried tendon suture in the closure of all abdominal wounds, except for a few months, during which time cat-gut was substituted for tendon. His method from the first had been essentially the same. The peritoneum is closed separately. This may be effected by suturing in a variety of ways. He employs usually the double continuous tendon suture which is easily and rapidly taken, by the use of a needle with the eye near the point, and which by rethreading with the opposite end, permits the introduction of the suture from either side through the same puncture. The result is an even, continuous and close apposition of the serous surfaces of the peritoneum, retained at rest without undue constriction. A fine tendon should be selected for this purpose. Dr. Marcy considers the accurate coaptation of the thick, investing fascia of the first importance. This is preferably effected by a line of sutures taken in a similar manner to the one closing the peritoneum. In quite 300 laparotomies, where a complete closure of the wound had been effected, he recalled but two cases of ventral hernia following the operation. One of the most common causes of hernia he considered to be the routine use of drainage tubes.

THE ESSENTIALS OF SUCCESS IN VAGINAL HYSTERECTOMY.

This was the title of a paper contributed by Dr. Henry T. Byford, of Chicago.

The author maintains that vaginal hysterectomy is an operation attended with little danger, and that the present mortality is caused mostly by

1. Operating upon unsuitable cases.
2. Imperfection in the technique.
3. Mistakes in the after-treatment.

He summarizes as follows:

1. Operate only upon cases in which we can operate in healthy tissue.
2. Use the method and maneuvres adapted to each individual case, not adhering rigidly to any one for all cases.
3. Ligature enables the surgeon to do a more complete operation than forceps, but forceps should be used when ligature cannot be applied with accuracy.
4. When possible, place omentum between the intestines and the stumps.
5. Draw the ligatured stumps together and attach the peritoneal edges either to the vaginal edges or to each other.
6. Pack iodoform between the blades of the forceps, but do not allow the packing to project upward between the intestines.
7. Leave the packing for four days as a rule.
8. Begin douches about eight hours after the packing is removed and use a return tube the first time.
9. Keep the patient on the back for forty-eigty hours.

He reports thirty-five cases with one death, or a mortality of 2.85 per cent.

THE PROPRIETY OF OPERATIVE MEASURES IN PELVIC PERITONITIS.

Dr. Lewis Schooler, of Des Moines, Ia., read a paper on this subject. He said the decision as to the propriety of operative measures and the time when they

should be resorted to in pelvic peritonitis were frequently beset with the greatest difficulties, and the only rule in acute cases, that seemed to him to apply at all generally, was one laid down by some author in intestinal surgery. That as soon as it was apparent that other means would be of no avail, the time for operative interference admitted of no delay. In chronic cases or cases with frequent recurrences, or chronic cases as regards time and acute with regard to symptoms, there were two periods when operation is justifiable. The first, when life was endangered during a recurrence, the second, after the subsidence of an acute exacerbation. This he regarded as the preferable period, but unfortunately it could not be always secured; first, for the reason that the acute stage might demand relief; secondly, the patient frequently refused the tender of relief of this character while the suffering was not intense. Under this head might be included all those cases of encysted collections of pus, gonorrhœal or otherwise, tubal collections of whatever character; diseased and degenerated ovaries, adhesions which gave the semblance of tumors by the distortion of the pelvic organs, and the consequent impairment of their functions, as well as all mental and nervous disorders that were directly traceable to disease of the pelvic organs.

THIRD DAY—AFTERNOON SESSION.

Dr. M. B. Ward, Topeka, Kansas, read a paper entitled

SURGICAL TREATMENT OF UTERINE FLEXIONS.

The author has found it extremely difficult, and very often impossible, to afford permanent relief in a large majority of cases of chronic retro-flexion by the methods usually recommended. He thought it was comparatively easy to give temporary relief in many cases, if gynecologists would persistently treat the patient by placing her in the the knee chest position, and gently rise the fundus and tampon the posterior vault with cotton wool, saturated with boro-glycerine. He referred to this method because he considered it as good, if not the best plan of treatment. When it is impossible to replace the uterus in the normal position on account of adhesions, this treatment softens the adhesions, relieving engorgement, and gives comfort. But the larger number of patients will give histories of long suffering, many attacks of pelvic peritonitis—some mild, some severe,—which will readily indicate that serious complications must be overcome before the uterus can be brought forward to the normal position. It is this class of cases that he was considering in the paper. His custom is to say to the patient that the local treatment will give comfort, and if she can exercise due patience she may be permanently relieved. He always informs them of the possibility of failure. The next plan recommended is to do an abdominal section, break up the adhesions, remove the appendages, if they are diseased, bring the uterus forward, all of which may be done in a few minutes safely, and he believes the patient will speedily and permanently recover. When surgical measures were indicated as the only source of relief, we should not refuse to employ them, even though it may be found necessary to remove organs adjacent to the uterus.

Dr. Franklin H. Martin, of Chicago, read a paper entitled,

A NEW OPERATION FOR UTERINE FIBROIDS, WITH REPORT OF CASES.

The author made a second supplementary report on his new operation of vaginal ligation of a portion in the broad ligament of the uterus for uterine tumors. The operation consists in the ligation from the vagina of more or less of the broad ligament with its vessels and nerves, the extent of the ligation depending upon the result sought, from a simple ligation of the base of the ligament, including the uterine artery and branches of both sides, without opening the peritoneum, to a complete ligation of the ligament of one side, including both uterine and ovarian arteries, with partial ligation of the opposite ligament, without opening the peritoneal cavity, if possible, but doing so if necessary.

The doctor reported five cases, two of these were reported in his first report of the operation. The result in the five operations were given up to date.

PROLAPSE OF THE FEMALE PELVIC ORGANS.

Dr. Henry P. Newman, of Chicago, read a paper with this title. He briefly called attention to prolapse of the female

genital organs with particular reference to their hernial nature. He regarded them as having a similar etiology, and the same pathological signficance as herniæ in other situations, and amenable to analogous kinds of treatment. He formulated the following conclusions:

1. Pelvic herniæ should be recognized and classified as such, and not as diseases of the uterus and adnexa; and their treatment should be based upon hernial pathology.

2. Prophylaxis, in the formative stage of puberty, as well as in pregnancy and labor, is of the utmost moment in this class of cases.

3. Operations upon the pelvic floor or vaginal walls, while indispensable in their place, cannot be relied upon alone to cure all herniæ of the pelvic viscera.

4. The ideal treatment is to befound in the combination of operations for repair, and those for accessory support from above, and these may all be accomplished at the same sitting, saving the delay and annoyance of repeated operations.

Dr. William Humiston, of Cleveland, O., read a paper on

COCAINE, ITS USES IN GYNECOLOGY.

He has had 5 years experience in the use of cocaine in gynecological operations, and he does the following operations with no other anæsthetic than it: Dilating, curetting, trachellorraphy, anterior and posterior colporraphy, and perineorrhaphy, frequently making two of these operations at one sitting. In dilating and curetting primipara he resorts to cocaine in preference to chloroform or ether. The pain produced is but slight, and the convalescence is uninterrupted and rapid. It is essential that a reliable preparation of cocaine be used, and he relies upon Squibb's or Merck's. He prepares them in two strengths—a four and ten per cent. solution; the former for hypodermic use, and the latter for intra-uterine injections preceding curetting. He prepares but small quantities at a time, only one drachm of each strength made from sterilized water, to which is added one drop of pure carbolic acid to prevent the solution changing or depositing flaky particles. The quantity of cocaine used for each sitting is from $\frac{3}{4}$ to 2 grains; where but one operation is done he uses from one-half to one grain. In colporrhaphy he injects a 4 per cent. solution in a circle surrounding the portion of mucous membrane to be removed, and this anæsthetizes the whole portion, and denundation can be done with but little bleeding and no pain. The author then briefly reported a few cases in which he had used cocaine with great satisfaction.

Dr. Joseph Hoffman, of Philadelphia, read a paper on

ECTOPIC PREGNANCY, ITS COMPARATIVE SYMPTOMATOLOGY AND TREATMENT.

He said that gynecologists were widely at variance in reference to their expressed views relative to the diagnosis of ectopic gestation. So far as diagnosis was concerned, the term may be almost used synonymously with symptomatology, for upon the latter the former must depend, so that when we find a writer holding that there is a positive chain of symptoms, in connection with which a physical examination will or will not point to the presence of ectopic pregnancy, we will find that he will also claim his ability to diagnosticate the existence of the condition. The misfortune was that those who most widely argue the possibility of exact diagnosis had had the least, and in most cases the most meagre, abdominal ezperience.

In the treatment, Dr. Hoffman enunciated his belief by quoting the words of Stephen Rogers, who said: "*The peritoneal cavity must be opened*; *the bleeding vessels must be ligated.* He indeed must be a madman who under such circumstances would neglect everything in his power to secure the chances such an operation would afford of saving the life of his patient."

Dr. A. H. Cordier, of Kansas City, read a paper entitled

EXTRA-UTERINE PREGNANCY,

in which he said that while his experience in extra-uterine pregnancy had not been an extensive one, it had been characterized by a multiplicity in number, considering the length of time since he saw his first case. In two years in his own practice and in that of others in which he had assisted in the operation, he had an experience of 16 cases. The duration of pregnancy had extended over as wide a range as the location of the fetus had in variety; from six weeks to two years, from a soft gelatinous embryo to a well formed 9 pound child,

from a cob-nut sized embryo in the tube to a full grown child in the broad ligament. It was only in the tube ectopic gestation took place, and all other varieties were only made so by rupture of the tube as the fœtus develops; tubal abortion (?) being the exception, it may be excluded from the list with safety. It was evident that all cases of tubal pregnancy ruptured at some period, unless the growth of the fetus was stopped by some means, but the methods advocated to check the growth of the embryo were so uncertain in their results, so unsurgical and so dangerous to the mother, and the diagnosis so doubtful prior to rupture, that they are to be practically excluded from the management of these cases. Intra-peritoneal is to extra-peritoneal rupture in the proportion of three to one. When rupture takes place between the layers of the broad ligament, the hemorrhage is limited by the resistance offered by the surrounding structures, death rarely occurring to the patient from the first rupture.

Dr. Cordier then reported an interesting case, intra-ligamentous, the child full-grown, and retained nearly two years. The operation was done by himself, assisted by Dr. Griffith.

Dr. Llewellyn Eliot, of Washington, D. C., read a paper entitled

THE ACCOUCHEMENT FORCE IN CERTAIN OBSTETRICAL COMPLICATIONS.

He defined accouchement forcé as a labor actively begun and terminated by artificial aid either through dilators, tampons, Barne's bags or the fingers. He urged as his opinion the superiority of the fingers over all mechanical devices in use, as well as the most harmless. This mode of practice is indicated in cases of uremic convulsions either threatening or in existence, rigid os, placenta previa, uterine inertia and other conditions requiring artificial aid. He deplored the fact that text-books and journal articles on obstetrics were silent upon this old method and quoted, Charpentier, Winckel and Lusk as being opposed to it. He denied the method would be attended by untoward effects—post-partum hemorrhage, laceration of the cervix, uterine inertia—more frequently than by other means. He recited the history of four cases where the method had been employed by him, two of uremic poisoning with threatening convulsions, one of placenta previa, and one of rigid os, all of which terminated favorably.

Dr. George H. Rohé, of Cantonsville, Md., read a paper entitled

LACTATIONAL INSANITY.

He said that recent careful study of insanity during the lying-in period had shown its frequent dependence upon septic puerperal processes. Certain observations of his own presented to the section at the last annual meeting might, he thought, be regarded as comfirmatory of this view. In studying the causes of insanity during the period of lactation, not sufficient discrimination had hitherto been exercised by writers on the subject, although Gooch, as early as 1829 called attention to the necessity of such discrimination. Even in cases where the psychical symptoms of the attack are carefully recorded, too little attention has been paid, in the author's opinion, to the bodily condition. Of course, such marked characteristics as anemia, or unusual emaciation could not fail to be noted by the most superficial observers, but the cases where a careful and thorough examination of the condition of the bodily organs has been made are rare. In insanity, the psychical phenomena are generally so striking as to over-shadow bodily anomalies and thus these fail of notice. Among the most recent authorities, however, Dr. Bevan Lewis regards the exhaustion and sequelæ of labor and defective uterine involution as important etiological factors, especially in the earlier cases of lactational insanity. Levinstein-Schlegel also lays stress upon local diseases and displacements of the pelvic organs as causes. This author says "That the local (pelvic) irritations acting upon the central organ (brain) are active both as determining the duration as well as the course of the mental disorder." Dr. Rohé then reported five cases of insanity, beginning during the nursing period, which had been admitted to the Maryland Hospital for the Insane in the last two years. They formed 7.4 per cent. of the total number of women admitted during this period. The cases were classed clinically as melancholia 2, mania 1, and confusional insanity 2.

Dr. Rohé closed by saying that the treatment of lactational insanity resolves itself simply into the exercise of therapeutics.

Remove sources of irritation, correct aberrant functions, restore wasted strength. These principles, if consistently carried out, will usually lead to success.

THE ABUSE OF EMMET'S OPERATION FOR LACERATION OF THE CERVIX.

Dr. E. C. Dudley, of chicago, read a paper on this subject, in which he said the most common faults in the execution of trachelorrhaphy may be indicted as follows. The operation may fail or do no harm:

1. Because the operator has disregarded the presence of granular endometritis.

2. Because the os externum has been closed so tightly as to obstruct the free out-flow of uterine secretions and menstrual fluid.

3. Because the cicatricial plugs in the angles of the laceration have not been removed.

4. Because cervical glands have been rolled into the cervical canal where they find expression either in the form of cervical catarrh, or of retention cysts.

Dr. Dudley said, in closing, that the evil results consequent upon the abuse of Emmet's operation were frequently encountered, and a large part of the most necessary work in connection with this operation at the present time consisted of conservative surgical procedures, the object of which was to undo work which had already been done. If the abuse of the operation has done much harm, the misguided practitioner must bear the burden of his own fault, the operation must not be made to do so for him.

FOURTH DAY—MORNING SESSION.

Dr. Carey K. Fleming, of Denver, Colo., read a paper on

THE MANAGEMENT OF PATIENTS AFTER CELIOTOMY.

He said the first symptoms requiring our attention, after the patient had been placed in a warm bed, and recovered from the anesthetic, were nausea and vomiting. Thirst, a condition which annoys the patient as much as nausea, was controlled somewhat by leaving the abdomen well filled with warm or hot sterilized water. This is rapidly absorbed by the peritoneum, quenching the thirst to a considerable degree. Warm water per rectum acts often in the same way. In cases where he is unable to control the patient's pain otherwise, he is in the habit of giving 15 or 20 drops of the deodorized tincture of opium, per rectum, as often as is required. The use of laxatives may be commenced as early as the second day and certainly not later than the third day after the operation, and continued until peristalsis is re-established. For this purpose it was his custom to give small doses of calomel, in powders of one-tenth grain each, every hour until the desired effect was obtained. The author then dwelt upon the prevention of colic or abdominal distension after celiotomy, the indications for reopening the wound, and diet.

The following officers were elected for the ensuing year:

Chairman, Dr. Joseph Eastman, Indianapolis, Ind.

Secretary, Dr. George I. McKelway, Philadelphia, Penna.

AMERICAN SURGICAL ASSOCIATION.*

The meeting of the American Surgical Association occurred in Buffalo, May 30, to June 1, inclusive. The first session opened with an addressing of welcome by Prof. Matthew D. Mann, Dean of the Medical Department of the University of Buffalo. Dr. Mann alluded to the attractions of Buffalo as a city and to its recent but increasing influence as a medical center. He referred with pardonable pride to the well-equipped college building into which teachers and students of the University had moved for the latter part of the session just ended, and whose Alumni Hall afforded a convenient amphitheatre for the sessions of the Association.

Dr. Nicholas Senn, of Milwaukee, thanked the Association for the honor of election as president, conferred upon him in his absence from the last meeting. He wished, however, to offer, instead of the typical address, a paper.

Dr. Senn's address was notable for the fact that in spite of a rather agreeable foreign

*Special correspondence to THE MEDICAL AND SURGICAL REPORTER.

accent, his sentences were idiomatically and elegantly worded, even when he spoke without notes. The following quotation contains in brief the substance of his paper. "No systematic effort has been made to utilize the wound in compound fractures to facilitate the union of bone. . . . . The time is at hand when a compound fracture should be treated along the same lines as wounds of soft parts, namely by holding the separated parts together by temporary means directly applied." Delayed union, non-union, paralysis, impairment of general health, shortening, angular deformity, exuberant callus and permanent injury to adjacent joints were mentioned as some of the untoward consequences of fracture which he hoped to remedy by his method. The oldest method of accomplishing direct fixation of a compound fracture was by suture. Various kinds of material, absorbable and non-absorbable have been used for sutures, and the discovery that small foreign bodies, if aseptic, were encapsulated led to the plan of leaving silver wire sutures in place, turning the ends in. These sutures were defective, however, in that they could not prevent motion except in one or two directions. Moreover, in oblique fractures with a marked tendency toward shortening, the tendency of the suture might cause serious interference with nutrition and thus prevent union of bone. Dr. Roswell Park had lately demonstrated the applicability of silk-worm gut suture as a substitute for silver wire. Bone ligatures, the steel screws of Langenbeck and the iron spikes of Dieffenbach, the use of solid ivory cylinders in the medullary cavity by Volkmann, Heine, and Viertner, and other devices were discussed. Experiments with ivory and bone had shown that small pieces only were absorbed and that pieces placed just outside the lining bone or within its medullary cavity, were absorbed much more quickly than pegs driven into the shaft. For these reasons, Dr. Senn was led to believe that a thin, perforated bone cylinder used as an intra-osseous splint or as a supporting external ring would be preferable to the older devices. In a very oblique fracture where local measures were most needed, the intra-osseous plug was of little service, whereas the encircling cylinder would hold the fragments together. The tendency to override each other would only hold them the tighter in the grasp of the ring, the perforations would allow ample opportunity for the outgrowth of granulations and the thin bone ring would be absorbed. Dr. Senn uses sections of the femur and tibia of an ox as "*ferrules*" in the treatment of fractures of the corresponding human bones. A sixth of an inch or less is the proper thickness and if it is more than half an-inch long, it should be perforated like a drainage tube. After controlling hemorrhage, the ferrule having previously been applied the, wound should be closed, layer by layer with buried sutures and a plaster-of-Paris bandage applied over the antiseptic dressing. If the wound requires drainage, the external splint should be so applied as to allow access to the wound without removal of the splint. In aseptic wounds, the ferrule is absorbed, in septic wounds it should be removed after union has occurred. Removal is facilitated by enlarging the sinus and cutting the ring in halves.

The discussion was opened by Dr. Roswell Park, of Buffalo, who approved of the general conclusions of Dr. Senn. As a rule, he preferred to dovetail ununited fragments together and bind them by ligatures of chromicised cat-gut rather than to use the bone suture. In the method by suture, the main difficulty was in passing the suture through the drill-hole. It was much easier to wrap the ligature around the bone with the aid of an aneurism needle. He was afraid of using ivory in these cases. He thought that in some instances the manipulation necessary to apply the bone rings might disturb the soft parts sufficiently to cut off nutrition of the bone and thus cause necrosis.

Dr. Dennis, of New York, said that the question of sepsis in the treatment of ununited fractures could be entirely eliminated. Some years ago the mortality in Pennsylvania Hospital was 68 per cent., which was considered excellent. Antiseptic surgery had brought it down to 2 or 3 per cent.. In 1890, Dr. Dennis reported 1,000 cases seen in metropolitan hospitals, with one death. He believed that the choice of the method was unimportant so long as the wound was kept aseptic. His favorite method was to use the Brainard drill and drive in little ivory pegs. He

had never failed, although, in some cases, a second or third attempt was necessary. In oblique fractures—as well as in simple fractures of the tibia and especially in communited fractures—he thought that a tenotomy would secure physiological rest, add to the patient's comfort and facilitate union.

Prof. DeForrest Willard, of Philadelphia, had used the bone suture of silver or silk-worm gut almost as a routine treatment of compound fracture. Like Dr. Park, he had found the drilling of the bone easy compared with the passage of the suture. He had, therefore, devised a drill with an eye near the point so that the suture was carried through with the drill and protected by a groove. He agreed with Dr. Senn as to the difficulty of having ivory absorbed. He had seen Gluck's experiments with solid cylinders of ivory, and, with one exception, all had been pushed out or discharged through a sinus. The one successful result occurred in a case in which a small piece of ivory had been used in place of a metacarpal bone, and, as Dr. Senn had noted, the tissues could dispose of small ivory pieces. In all fractures, he believed the main element was absolute fixation, which, as a general rule, was best accomplished by plaster-of-Paris. The plaster dressing should never lie like a loose shell around the limb, but should be split open and tightened. Some, however, in springing the cast off, disturb the fracture. It is better to take off a cover from the front of the cast. He had noticed that plaster-of-Paris seems to prevent decomposition, since the blood-stained casts have no odor.

Dr. Tiffany thought that most cases of comminuted fracture would unite with external fixation and said that he could not see how the bone rings would be applicable if there were more that two fragments.

Drs. Richardson and Warren mentioned a case at the Massachusetts General Hospital of ununited fracture on which they had operated several times without success. The patient was five feet, eight inches high and weighed 300 pounds, while his general health was not good. The long cortex was very thin and the medulla fatty. Both thought that Dr. Senn's rings might have been useful in this case.

Dr. Senn in the summing up, explained that he would not urge his new method except in cases where mechanical prevention of displacement was necessary at the seat of fracture. In the application of bone sutures, it is necessary to bring the bones out into the wound, in the use of the rings the ferules are brought down to the bone fragments and it is not necessary to interfere much with the position of the bones. The main virtue of the treatment is the coaplation of periosteum to periosteum, bone to bone, medulla to medulla, utilizing the wound already existing.

In the absence of Dr. W. T. Briggs, of Nashville, who was to have presented a paper on "Pneumotomy for Removal of a Horse-shoe Nail from the Right Lung of a Child," the Association passed into executive session.

The afternoon session opened with a paper on "Hypertrophies and Degenerations of Cicatrices and Cicatrical Tissue," by Dr. J. Collins Warren, of Boston. Although the paper was of much wider scope, the discussion turned largely on keloid, which had occupied a good share of Dr. Warren's attention. Speaking of the terms, false and true keloid, and the question as to whether the difference was an essential one, he said that it was highly probable that the keloid does develop from a minute scar and is, therefore, not spontaneous. Still, he thought the difference was a clinical one, resting on microscopical evidence. Both consist mainly of connective tissue fibres running parallel to the surface, but in false keloid the preëxistence of a scar is indicated by the thin superficial layer of epithelium with felt-like cicatrical tissue beneath, whereas, true keloid is covered by a nearly normal epithelium with papillæ of the cornium beneath. In only one case of true keloid had he found the papillæ wanting and, in it, the tumor was of large size and was located where the papillæ were not normally conspicuous. He suggested several means of preventing the excessive formation of cicatrical tissue—buried sutures should be of animal tissue rather than silk, very superficial stitches should be more frequently employed, exuberant granulations should be destroyed with caustic or by scraping, the regenerative power of the skin should be recognized. The latter suggestion applied particularly

to the avoidance of disfiguring scars on the face and involved Lassar's method of scraping the thin epithelial covering to to the edge of the ulcer so that the true skin should encroach as far as possible.

Dr. Fowler, in the discussion, referred to the fact that a keloid at first resembles a sarcoma, later a fibroma. He mentioned three cases of amputation of the breast for carcinoma in which the scar was twice excised under the belief that it was cancerous, but miscropic examination showed only keloid. The patients, however, died later of malignant disease of the internal organs.

Dr. Tiffany said that keloid was quite common in the south, especially among negroes. It was rare, however, in negroes before the age of ten and after middle life. Retrogressive changes usually began about the age of forty in the negro and in white people there is rarely enlargement after the twenty-fifth year. He, therefore, advised against operation.

Dr. Warren in closing brought out the opinion that the contraction of the cicatrix was not due to an inherent property of scar tissue but to the absorption of part of the mass. In support of this view he instanced the yielding of scar tissue before the pressure of a hernia. Dr. Warren passed around some illustrations of cases and of microscopical appearances. He had noticed in keloids taken from negroes that there was a considerable admixture of fusiform cells which appeared to be smooth muscle fibres. Was there any connection between this fact and the frequent occurrence of uterine leiomyomata in the colored race?

Dr. M. H. Richardson, of Boston, read a long and interesting paper on surgery of the gall-bladder, embodying his own experience. Most gall-bladers demanding operation are large, a fortunate circumstance, since one of normal size is difficult to operate upon. Dilatation of the gall-bladder may result in a large cyst, filling the whole right side of the abdomen. In such cases, the cystic duct is usually closed and the biliary pigment may have been absorbed, leaving a colorless fluid. In the abscence of pain and constitutional disturbances, there is no indication for operation. It is justifiable to remove calculi as soon as they are diagnosed unless serious organic, especially malignant, disease exists. Cholæmia with much pain, and in the abscence of organic disease of the liver, demands operation unless the attacks of colic are short. But it is comparatively safe and easy to remove a stone from the gall-bladder, difficult to remove the same stone after it has become lodged in the common duct. Various diagnostic points were considered by Dr. Richardson who emphasized the difficulty of exact diagnosis by the statement that in six of his twenty cases, malignant disease was found instead of the expected calculi. He illustrated, by black-board sketches, the exact typographical anatomy of the gall-bladder, the ducts and vessels. His incision is made outside the rectus muscle in the triangular space between the rectus, the free border of the ribs and the external oblique muscle. The external wound is an inch and a half long, the opening through the transversalis fascia only half an inch. Dr. Richardson laid great stress on the value of dry dissection and said that the loose areolar tissue allowed the vessels and ducts to be quite easily separated. "Unless you can see what you are doing, never cut." When the gall bladder is contracted and friable, an escape of bile into the peritoneum is practically inevitable. In such cases Dr. Richardson has inserted a drainage tube into the cystic duct, wrapping gauze around it to protect the peritoneum. Sepsis has not resulted. Cholecystectomy should not be attempted unless the gall bladder can be dissected from surrounding structures. Even then there is apt to be an excessive outflow of bile as soon as the ligature becomes absorbed and the drainage tube affords protection against this accident. As soon as the fistula has become established between the remains of the cystic duct and the outside, the parts close in rapidly from all sides and "the bladder is no longer a receptacle for bile or a quarry for stone." The cystic duct cannot be catheterised nor dilated from the gall bladder. A soft stone lodged in it may be crushed. If a duct is incised, it may be closed with fine sutures but even then there is apt to be an escape of bile.

Dr. A. Vanderveer led the discussion. He spoke of a temperature curve similar to that of intermittent fever as somewhat diagnostic of gall stones. His attention had been called to this symptom in a case in which there was a tumor in the right side of the abdomen reaching down to the inguinal region. The tumor was thought

to be a floating kidney put proved to be an enlarged gall bladder. The gall stone was lodged in the cystic duct so firmly that it could not be extracted. It was, however, crushed and the fragments were pushed on into the duodenum, when intestinal gas issued, showing that the passage was free. He agreed with Dr. Richardson as to the location of the outer wound. He had seen an operation commenced with the median incision and abandoned because the gall bladder could not be found. Later, it was learned that the gall bladder was contracted and firmly bound to the under surface of the liver by adhesions. He also agreed with Dr. Richardson that the ideal cholecystotomy, that is the suture and return of the bladder after removal of the calculi, was somewhat dangerous. But he thought it preferable to ligate the cystic duct and leave the withered gall bladder in place, thus practically accomplishing cholecystectomy without removing the gall bladder.

Dr. W. H. Carmalt spoke of a case in which he operated for what was supposed to be floating right kidney, there being the history that an eminent German surgeon had sewed the same kidney in place and that the trouble had returned. The tumor proved to be a gall bladder distended with calculi. The stones were removed, the bladder sutured continuously with cat-gut, returned to the abdomen and the wound closed. The patient recovered completely and died three years after of another trouble. At the autopsy the left kidney was found in the pelvis. It had two arteries and two ureters. Dr. Carmalt had intended, before removing the supposed floating kidney, to search for the left kidney which evidently would not have been found.

Dr. Theodore A. McGrar described his experiments in making anastomoses in animals and showed some very interesting specimens. He had found that linear communications soon closed on account of the cicatrical contractions, while end to end junctions remained patulous even if the edges of mucous membrane were not in exact apposition. The idea therefore occurred to him of making an H shaped or triangular incision in the gall bladder, dissecting up the flaps, turning back a similar flap of duodenal wall, uniting peritoneal surfaces by silk-worm gut while the mucous and submucous layers of the gall bladder made a nipple-like projection into the bowel. He thus hoped to imitate the natural papilla at the opening of the common bile-duct. He had found that the papilla did not persist but that the opening remained permanently.

Some other discussion followed, which, with the summing up of Dr. Richardson, had to do mainly with the question of drainage, especially the value of the gauze packing about the rubber tube.

Medical Practice in Germany.

(*a*) Medical practitioners have no special rights any more than in England. Unqualified men are even eligible as club doctors under the term Natur Aerzte, or nature doctors, and many such hold these appointments. They only must not call themselves "Approbirte Aerzte" or assume any title implying that they are "approbirt" or legally qualified.

(*b*) There is no punishment for irregular practitioners so long as they do not pass themselves off as legally qualified, the punishment for such an offence would be by fine or imprisonment or both.

(*c*) Prescribing by chemists is illegal and offences of this kind would be punishable by fine or possibly loss of licence which every chemist has to take out.

(*d*) The same with regard to dispensing by doctors it is illegal except in the case of "homœopathic" physicians. A special law was recently passed giving them permission to dispense on the ground, I suppose, that as their so-called drugs were practically non-existent, the dispensing of them could hardly come under the term dispensing as understood in law.

(*e*) The sale of poisons is regulated as in this country, but on the whole more rigidly.

(*f*) Patent medicines are not recognized by law nor allowed. If a secret remedy is advertised the public analyst analyses it and publishes the analysis in the public papers, at the same time, stating the retail price of the various ingredients and the whole when put together. This cuts the ground from under the vender's feet. — *Med. Press and Circular.*

A typewriter for the blind has been invented, with printed embossed characters.

The Medical and Surgical Reporter

ISSUED EVERY SATURDAY

ADDRESS
Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D.,
Editor.

RODERIC C. PENFIELD,
Publisher.

316 - 18 - 20 North Broad Street,
PHILADELPHIA.

TERMS:—Five Dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

REMITTANCES should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

NOTICE TO CONTRIBUTORS:—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, JUNE 17TH, 1893.

EDITORIAL.

"THE ITCHING PALM."

The MEDICAL AND SURGICAL REPORTER makes no pretense to formulate or dictate policies for medical schools or other institutions, but it offers no apology for freely commenting upon and criticising such policies when the interests of the profession at large, or that portion of it more immediately and locally concerned, are involved.

Some facts are so thoroughly established as to need no demonstration. With especial reference to medical schools a few of these facts may be stated as follows:

The reputation of a medical school is made, sustained and directly dependent upon the reputation and work of its corps of instructors.

The greatness of a medical school is in direct proportion to the fame and ability of its teachers.

The greater the reputation of a medical school the greater is its obligation to sustain its good name, and for no consideration should it permit of a deterioration in the character of the staff on which its fame rests.

The fame of a medical school is conferred upon it by the great men connected with it, and mere connection with a medcal school, however great, will not make an inferior man famous.

More brain and less money will accomplish greater results than will more money and less brain.

The responsibilities of a medical school are not fully met by satisfying the petty personal or political ambition of individuals whose existence is known only within the narrow confines of the social relations of the 'powers that be.' Its obligations are its alumni, to the entire profession, to the community in which it is located and which gives it generous support, and more or less directly to the public.

Whether or not ability receives full compensation for its services, in this day

keen competition between medical schools brains are at a premium. The higher the quality of ability the greater is the cost of its service, and its value bears a direct proportion to its cost. Services that cost nothing are worth just exactly what they cost; but when it comes to selling a chance to serve, the value of the service rendered will be in an inverse proportion to the premium demanded.

In the course of nature vacancies must occur and changes must be made. To give opportunity for development to the younger men of obvious "promise" is a wise policy. Wise, if achievement has given earnest to the "promise." Foolish unless the promises assure credit rather than cash, pregnant with brain rather than boodle, and secure the command of intellect rather than of influence. Promises that are at least partially fulfilled by demonstrations of personal power and not of political "pull." But this plea is specious when used by a great school as an excuse for putting into a responsible position an utterly untried individual. A school has no right to make experiments in positions of great trust when it has abundant facilities to test material in minor positions, and to amply determine the fitness of aspiring buds of promise. Even then the qualities must be most marked to justify, for the sake of economy, passing over men who have already achieved greatness.

It is always easier to destroy than it is to build up, and the school that undertakes to sell its offices to the highest bidder is in a fair way to speedily realize this fact.

Until comparatively recent years Philadelphia has been recognized as the great medical centre of America. It is no longer pre-eminent beyond dispute. Other great cities are losing no opportunity to strengthen their institutions, and, in the sharp competition of this age and country, one or two of these cities have come to equal, and in some respects even surpass, medical Philadelphia. This has not been brought about by any deterioration in the quality or ability of the local profession, nor in the superior opportunities and advantages which Philadelphia possesses, but rather by a lack of concerted effort on the part of Philadelphia practitioners to assert themselves, by allowing the management of medical affairs to drift into the hands of a few, and, perhaps, by allowing personal considerations too much prominence in scientific matters. If, in addition to this state of affairs, our great schools adopt policies that threaten their pre-eminence it will not be many years before Philadelphia will have lost all claim to her former greatness.

An uneasy desire to augment resources, even at the risk of diminishing effectiveness, seems to have seized upon some of our greater medical schools, and to have blinded their managers to the perils of "dealing in futures."

It may be brilliant diplomacy to bring about as an apparent chain of coincidences the securing of an enormous appropriation from the public treasury; an affiliation which is an absorption of an institution of special purpose, practically paid for and supported by a confiding commonwealth but controlled absolutely by private individuals, and this, too, with at least two more years of state support out of all proportion to its deserts as shown by the work performed; to materially brighten the prospects of endowment; to recognize the arduous toil of a famous teacher, and accord him the pleasure of meeting, while yet in the prime of life, with the reward of his years of service by pasting on the honorary label of "emeritus," and transferring him from the field of his active work to the shelf where repose other relics of former greatness; and finally fill the chair thus made

vacant with a—possibility so thoroughly disguised that hitherto it has not even excited suspicion.

This may be rare diplomacy but it is likely to prove as unprofitable a policy as was that of the scriptural character who parted with his birthright for a mess of pottage. Even a rusty old screw adds more strength to a shaky chair than a two ounce tack, however brightly tinned. The tack however may be of use in re-upholstering the chair.

BACTERIOLOGICAL NOTES.

The Distribution of Lepra Bacilli in the Body.

Delepine and Slater (*British Jour. of Derm.*, Jan., 1893) give the results of a careful bacteriological examination of the tissues in cases of leprosy. All of their attempts to discover the bacilli in the lymph, blood or pus during the life of the patients proved negative. They are of the opinion that there is no means of differentiating the tubercle and leprosy bacilli by staining processes. The post mortem examinations revealed the presence of the leprosy bacilli in the skin (uniformly), in the mucous membranes of the mouth, pharynx, and larynx in certain nerves and special lymphatic glands, in the liver and in the bones. They were not found in the kidneys, supra-renal glands, thyroids and the mucosa of the stomach, small intestines and bladder.

They appeared in greatest numbers in the areolar connective tissue, and in the lyphatic glands.

Staphylococci Purulenta Cutanea.

Wickhaur (*British Jour. of Derm.*, July, 1892) has given the name of staphylococci purulenta cutanea to the bacteria which are the cause of certain skin diseases in which there is the formation of pus. The disease presents itself under such titles as furuncle, certain folliculitides and impetigo, according to the predominence of certain of its morbid elements. He believes, furthermore, that the large number of suppurative affections, whose specific cause is not yet determined, will eventually be placed among those caused by staphylococci. Attention is called to the fact, which bacteriological investigations have demonstrated, viz., that suppuration may be produced by many totally different causes. (1) Certain chemical substances free of bacteria, and, (2) by a very large number of different bacteria, including not only the generally recognized pyogenic forms but certain other well established pathogenic species such as the tubercle bacilli and the bacillus of authrax.

Thorner's Method for Selecting Tubercle Bacilli in Milk.

This consists of the following process: "20 cc. of the suspected milk are mixed with 1 cc. of a 50 per cent. potash solution and heated in a bath of boiling water until the fat is saponified, when the solution turns a yellowish brown. By this process the caseine and albumin become soluble in acid. Add 20 cc. of acetic acid, shake the solution, heat on water bath for three minutes, transfer it to a strong glass tube and turn in a centrefugal machine for 10 minutes. The liquid is then poured off and the sediment is washed by shaking it with 30 cc. of hot water and again centrifulized. The water is then poured off and the sediment placed on cover-glasses which are treated in the ordinary way of staining cover-glass preparations for tubercle bacilli."

Rhopalocephalus Carcinomatosus (New Genera and Species.)

Korotneff (*Centralblatt f. Bakteriologie n. Parasitenkunde*, XIII, 1893, p. 373) describes a new species of a parasite which he has found in cancerous tissue from the labia, mammary glands, etc. The adult form has a quite thick elongated body to which he has given the name *rhopalocephalus carcinomatosus*. In general the form resembles that of a cistodi. In the head a nuclear body is visible. The organism is represented as being from 3 to 4 times the length of

the diameter of the tissue (cancerous) cells. The outlines of the body are clearly defined. It forms no pseudopodia. Korotneff describes very carefully the development of this new parasite from its first appearance to its complete development. The relation which exists between it and the cancer is, of course, the most important consideration. The author thinks that the parasite is not the cause of the multiplication of the cells in the, cancer as the cancer grows in places, *i. e.*, in different directions or parts, where no parasites can be found.

The Germicidal Property of Light.

That sunlight has a more or less powerful effect upon bacteria has been known for some years. *Butchner and Minch* have systematically investigated the influence of light upon bacteria floating in water. The more important bacilli with which they worked are the bacilli of typhoid fever and cholera, although many other species were tested. The author's found, by way of experiment, that water containing 10,000 germs to the cubic centimeter became sterile, *i. e.*, freed from these living bacteria, after an exposure for a single hour to the direct rays of the sun. In another experiment similarly infected water was kept in the dark when it was found that a slight multiplication of the bacteria had actually taken place. Diffused daylight (not direct sunlight) had a marked destructive power on the bacteria after an exposure for several hours.

From these results the authors are led to the conclusion that the purification of natural water is chiefly accomplished through the influence of the sun's rays. The practical suggestion, based upon the above results, is that sewage should be exposed to sunlight before being poured into rivers or other water courses. In the exposure it should be placed in shallow basins lined with white cement. [Although the results obtained by the action of sunlight cannot be disputed, it seems reasonable to suppose, in the light of other experiments, that certain pathogenic bacteria are rapidly destroyed in water when not exposed to sunlight. The typhoid and cholera bacilli, however, are capable of living in water for a very considerable time and if the authors were able to destroying them by sunlight in so short a time as given, a truly beneficial discovery has been made.—Ed.]

TRANSLATIONS.

GASTRO-INTESTINAL ATONY.†

Cuffer (*Le Bull. Méd.*, March 8, 1893), gives some general considerations on this subject and emphasizes its great clinical importance. Atony, according to Litré and Robin, is a defect of tone, weakness of a contractile organ. It expresses a state of relaxation of the tissues. For a long time it was confounded with paralysis, and still this mistake is daily committed. There is, however, between these two morbid states a very sensible difference, of which it is important to take notice. Atony is a paresis, inertia, failure of activity of an organ, but with persistence of its function. The functionation is diminished but not lost. Paralysis, on the contrary, implies the abolition of movement, the loss of function. When a muscular group is struck with paralysis it is necessary to admit an affection either of the nerve-center or of the nerves; in short, an interruption of the communication between the muscular group and its motor-center, or a suppression of the action of their center. On the contrary, when a muscle is simply atonic the nerve-centers and the peripheral nerves are intact; the muscle itself is not sensibly altered in its structure.

In order that a muscle should contract naturally and possess the normal tone, several conditions should be realized; first the integrity of the structure of the muscular fibers, then the integrity of innervation, of the circulation, arterial, venous, and lymphatic, and of the blood itself;

†Translated for The Medical and Surgical Reporter, by W. A. N. Dorland, M. D.

finally, a normal state of the tissues adjacent to the muscular fibers. Such are the conditions that assure to a muscle its contractibility and its normal elasticity, that is to say, the two qualities which characterize the muscular tonus. The first, the most directly appreciable, is an active property of muscle, thanks to which it produces a useful work. The second is that passive property, in virtue of which a muscle momentarily distended resumes its primary form. Although less visible than the first, it is not less important. It is this property, in fact, which permits antagonistic muscles to act with the desired force and precision. For the proper functionating of a muscle, as has been said, certain conditions must be present.

1. It is necessary that the tonus should be normal, that the muscular tissue should be intact. Let us recall the myositis of typhoid fever or of variola. Following these infectious maladies, it is not rare to observe a pronounced feebleness of the muscles of the body. The appearance may even be that of paralysis, incorrectly. The muscular fiber is slightly degenerated, that is all. The muscles have been badly nourished, but they rapidly recover their functionating under a purely tonic treatment, while in a case of a true paralysis, considerably more time is required for them to regain their activity. The muscles in the convalescence of infectious diseases are therefore simply in a state of asthenia (amyo stheni); it is the atony of the first rank. Bat there is more; degeneration of a muscle is not necessary to cause atony. It suffices to produce the same result to submit the muscles for a long time to a maximum of elongation; this is a strained muscle, as a rubber band may be overdistended. It has lost its tonicity. As an example let me cite the uterus in the puerperal state. What is it that causes uterine inertia consecutive to labor? It is nothing else than the result of the overdistension to which it was submitted, as in a twin pregnancy, an hydramnios, or any other cause acting in the same way. It is for an analogous reason that the abdominal wall presents habitually in multiparæ the peculiar flacidity that is well-known.

A second condition no less necessary to the proper functionating of a muscle consists in the integrity of the arterial circulation, or, in other words, in a sufficient blood supply. If, in a given moment, this condition is not realized, the muscle becomes atonic. As one has said, "a muscle deprived of blood falls into paralysis." The term is not exact; it is not a paralysis, it is only a loss of vitality of the muscle; a paresis, if you wish.

3. It is not only necessary that the blood arrive in normal quantity; it is necessary also that the exchange continue to be made, that the effete products of muscular action be removed by the effesent vessels. When the return circulation is hindered, fatal muscular atony ensues. In practice, the most frequent and the most typical cause of hindrance in the venous circulation is a mitral affection which has reacted on the right heart. The compensation cannot be maintained and a general venous stasis is produced. Another type of atony of venous origin is furnished by the varices.

4. The blood may be furnished and removed in sufficient quantity, but it is yet necessary that it be of normal composition. Muscular tonus will not exist in the absence of oxygen, since it is the combustion of the gas that nourishes the muscle and assures in consequence, its functionating. It is the carbon that goes to nourish the machine. In certain poisonings, in particular in poisoning by carbonic acid gas, there is a sort of paralysis of the red corpuscles, as first noticed by Claud Bernard. In consequence, the hemoglobin, on account of its inferior affinity for carbonic acid gas, no longer fixes the oxygen; hence, the muscles become atonic. In certain affections there is at the same time, an insufficiency in the quantity and in the quality of the blood furnished. This is seen in chlorotics affected with aortic stenosis.

5. The normal functionating of a muscle presupposes the integrity of the nervous influx. If the nervous influx is diminished in its intensity, there results a state of muscular semi-impotence, otherwise called atony. The type of atony of this origin is realized in neurasthenia.

Finally the integrity of the neighboring mucous or serous surface is a last condition, as indispensable as the preceding, in order that the muscular activity be maintained in its normal state. Here is placed Stoke's Law, which has been rightly or wrongly interpreted according to the case. In each instance, it is for-

mulated in the following manner: "Every muscle in relationship with an inflamed mucous or serous membrane becomes paralyzed." It is, however, not a paralysis, but an atony. It is seen in the paralysis of certain muscles of the palate in severe angina or in the diaphragm in diaphragmatic pleurisy.

The stomach and intestines may be the seat of an atony, either singly or together, in the three great varieties, as follows: gastric atony, intestinal atony, gastro-intestinal atony. These varieties may offer still more numerous subvarieties. The immediate consequences of this atony are not the only, or even the most important; there follow other distant troubles, the reflex manifestations, cerebral, cardiac, pulmonary, etc. It is, therefore, a complex subject and involves an extensive line of study.

The Relations of Operative Gynecology to Insanity.

In a paper with the above title, read before the American Medical Association, Milwaukee, the author A. H. McFarland M. D., Jacksonville, Ill., comes to the following conclusions:

1. Gynecological operations are more likely than any other surgical procedures to disturb the mind.
2. Hereditary antecedents of the patients should always be determined.
3. In insane patients, operations should be performed only when the physical condition endangers or renders life insupportable.
4. Patients, precedent to the operation, should be in a calm frame of mind —hence, moral treatment of the patient previous to operating is the best prophylaxis.
5. Inherited and acquired insane constitution is the fundamental factor in most cases of insanity. This conclusion does not, however, justify us in ignoring physical diseases, immediately preceding or associated with insanity.
6. Healthy genital organs do not give rise to reflex symptoms, consequently caution should be exercised in operating for the relief of insanity.
7. Operations may be satisfactory in properly selected cases.

Do the Sick Ever Sneeze?

"Do those who are seriously ill ever sneeze?" This is a point alluded to by Mr. Jonathan Hutchinson in the January number of his *Archives*. He does not recollect himself to have seen any but fairly healthy persons sneeze. He puts the question with especial reference to the widely spread popular superstition that sneezing is a sign of health and good luck. It is possible, he thinks, that this may have had its origin in the fact that it is for the most part an act restricted to those in fair health. Tylor, in his "Primitive Culture," gives interesting facts as to the prevalence of this creed and as to certain customs associated with it, and traces it in part to doctrines of animism, but Mr. Hutchinson thinks the suggestion he has given may also have some value.—*Sheffield Medical Journal.*

Pills of Iodide of Potassium.

Here are some prize formulas submitted to the Pharmaceutical Society of Anvers as the best mode of making these pills.

℞
Iodide of potassium..... 0.25
Powdered starch..... 0.5
Simple syrup..... 1.0
For one pill.

Pulverize the iodide of potassium, add the starch in an impalable powder, and add the syrup to make a pillular mass softer than an ordinary mass. One thing to observe is to work up the mass thoroughly; otherwise it does not present the desired cohesion. Roll the pill in starch powder. Take of iodide potassium, the prescribed quantity, dissolve in a small quantity of water, add gum arabic in a sufficient proportion to obtain an ordinary mucilage, add then potter's clay in sufficient quantitity to make a mass which can be easily worked, and immediately roll into pills, for in a shord time the mass becomes hard. The pill can be rolled in potter's clay, or covered after the manner of iodide of iron pills. It is said that these pills keep perfectly without much care; they dissolve rapidly in water and after depositing the potter's clay give a liquid absolutely colorless.

It is better to go to bed hungry once in a while than to get up every morning head over heels in debt.

THE LIBRARY TABLE.

BOOK REVIEWS.

A Handbook of Local Therapeutics, by Allen, Harte, Harlan and VanHarlingen. Edited by Harrison Allen, M. D. Octavo—500 pp. Price $4.00. P. Blakiston, Son & Co., Philadelphia.

The need for a book of this character has long been apparent, for there has been no text available in which the *local action of drugs* was not subordinated to their general actions, while the average text-book omits altogether mention of many agents that in the hands of a specialist become valuable aids to cure.

Diseases which require chiefly local treatment are those of the respiratory passages, eye, ear, and skin, together with certain general surgical affections, including diseases of women; it is therefore to the great advantage of the book that each remedy has been thoroughly set forth by different authors who have had large practical experience in these various branches.

Each remedy has been taken up in alphabetical order, and, after a description of its pharmaceutical properties, is considered in reference to its physiological effect and value in local treatment.

The demands for thorough revision of local medicaments made by the advance of theories of asepsis, have been fully considered, and a succinct account has been presented of the source and properties of the very numerous new agents which affect tissues locally.

Some drugs have been excluded which have been highly praised; on the other hand great care has been taken not to indorse imperfectly attested novelties.

This handbook embodies the results obtained by experienced teachers, and will prove a very valuable work to the general practitioner. Two carefully made indexes make it a book of ready reference.

Deutsche Archive fu. Clin. Med. Edited by Dr. H. Ziemssen and Dr. F. Zenker. Published by F. Vogel, Leipsig.

Contributions to the Pathology of the Heart, by Dr. Hochaus, of Kiel.

I. A case of congenital opening of the ductus botalli, found in a patient, aged 24, who seemed well up to his twelfth year, but after that complained frequently of periodical pain in the region of the heart, accompanied by palpitation.

The patient was admitted to the clinic on February 15, to be treated for chillblains; owing to the above mentioned cardiac symptoms he was sent to the medical clinic on March 15. An examination revealed a systolic murmur at the apex, and insufficiency of the mitral valve, with dilatation of the right heart; the presence of fever and albuminuria pointed chiefly in the direction of an acute endocarditis. The diastolic murmur heard at the second intercostal space and the left intraclavicular region seemed to point to the pulmonary artery as its origin; other symptoms of aneurism being absent.

Another explanation was that the ductus botalli had remained open, causing this diastolic murmur. The patient died of pyæmic endocarditis on the sixth of July.

Post-mortem examination verified the diagnosis. Endocarditis of the pulmonary valves and artery, the open ductus botalli; the arch of the aorta and the mitral valves.

Here follows a detailed account of an accurate study of the heart and other pulmonary and abdominal organs.

The author in looking up literature has found twenty similar cases.

II. A description of two cases in which immediately following a contusion of the thorax. A previous healthy subject suffered from dyspnœa, pain in the back and chest, slow and irregular pulse the undoubted symptoms of myo-carditis.

III. A report of two cases of aggravated tachycardia (200 contractions of the heart to a minute). In the first case it resulted from over-exertion, the attacks were short but repeated themselves at an average of every six months, a very slight dilatation of the heart remained. This was followed secondarily by some emphysema and bronchitis.

The author seems to have believed that it may primarily be due to a paralysis of the vagus nerve or irritation of the sympathetic.

The second case is interesting from a number of attacks under observation thus permitting the noting of the changes of the heart and later the opportunity of a post-mortem examination.

As a therapeutic agent the author found digitalis of value.

Scarlet Fever in The Adult, by Z. Gimmel, of Zurich.

In the years 1881 to 1889 there were 1818 cases of scarlet fever treated by physicians, 15.08 per cent. of these cases were adults, while in the other years, the percentage among adults ranged 7.81 per cent. and 12.09 per cent. It increased in 1888 to 19.91 per cent. and in 1889 to 20.08 per cent. The reason given for this remarkable increase is, that in the last two years greater epidemics existed, while in the former years there was no marked epidemic. As a rule adults became infected in families where children were first taken.

On the whole there seems less disposition among the adults than the children for scarlet fever. Its course is less severe in the adult, nephritis more rare and in a lighter form. On the other hand articular rheumatism is more frequent, and does not lead to grave complications.

A description of three cases in which the infection started from wounds, closes the instructive study.

Clinical Studies of Articular Rheumatism, by Dr. A. Stoll, of Zurich.

The author has made a statistical study of 572 cases of articular rheumatism, acute and chronic, which occurred in the medical clinic of Zurich, between the years 1881 and 1890. The greater number occurred in the third decennium, 48.2 per cent. There are twice as many cases among the males as the females. The cause given is the greater amount of

exposure to cold. Closer study proves that exposure to cold is not of such great moment as a possible infection. He cites that thirty soldiers became attacked in rapid succession in the barracks of Zurich. Careful investigation showed a lack of proper hygienic sanitation. Heredity was found to be the cause of 5.3 per cent.; returns were numerous. The lower extremities were most frequently attacked; as complications we find endo-carditis most frequent. In 9.2 per cent., cardiac diseases were set up; other complications are pleuritis, pneumonia, bronchitis, angina, coryza, epistaxis, nephritis in four cases, purpura rheumatica. Salicylic acid and salicylate of soda in doses of 0.5 to 1.0 were given with good results. They will not shorten the attacks but they lessen the mortality. In cases where the salicylates fail to act, antipyrine was given with good effect. In sub-acute and chronic cases, iodide of potassium, immobilizing the joints, and carbolic acid injections were successful.

Contributions to the knowledge of Pseudo-Leukemia, by Dr. A. Westphal, Leipsic.

The author has collected twenty-one cases from the clinic at Leipsic, which he reports in detail, and, after thoroughly studying them from the clinical as well as the pathologico-anatomical standpoint, he conclues as follows:

First. Pseudo-leukemia is in all probability an infectious disease.

Second. A direct connection with tuberculosis is improbable and could be definitely settled, however, by bacteriological investigations and vaccinations.

Third. In a number of cases there seemed to be local affections, particularly of the aural cavity and its surroundings.

Fourth. It is a rare occurrence to find leukemia end in pernicious anæmia.

CURRENT LITERATURE REVIEWED.

THE MASSACHUSETTS MEDICAL JOURNAL for June. Dr. J. R. H. Jones discusses the subject,

Is Superfetation Possible?

The author quotes the opinions of various observers in regard to this interesting question. He disregards those cases in which there is a possibility of the case being one of twin pregnancy in which the woman has aborted of one twin while the other has gone on to full development.

He draws the sharp distinction that, to constitute *true* superfection, it is necessary that the woman should not only bear *two* children, but their births must take place at different times—the deliveries being separated by an interval of time sufficient to preclude the possibility of their being twins. The children must be of different ages, and while the mother nurses one, she must be pregnant with the other. These conditions he regards as essential to true superfetation.

A double uterus will account for some of the reported cases, but not all. The author also calls attention to the fact that the subject, besides being a matter for speculation, may possibly have important medico-legal bearings. A case in point is where a woman married shortly after the death of her husband; seven months later she gave birth to a child apparently mature, and two months later to another mature child. The question might arise as to whether the first child was the offspring of the first or of the second marriage.

Dr. F. H. Gibby contributes a paper on "The Surgery of Childhood."

Dr. Robert A. Reed contributes a paper on

Daltonism or the Inability to Distinguish Colors.

The term "Daltonism" derives its origin from an English chemist Dalton, who suffered from this chromatic defect and, in 1794, gave to the scientific world its chief knowledge of the subject. The expression color blind, does not mean that one is really blind to colors, that they make no impression on him, but that he sees them another way. The color blind themselves, are divided into classes, as they do not all see colors the same way. The red blind, can no more see as the green blind, than as one of normal vision. What is called the "Young Helmholtz theory of color sense" is the one now adopted. It is in brief as follows: There probably are in the eye three sets of nerve elements for the perception of color. Stimulation of one causes the sensation red; of the second, the sensation of green; of the third, the sensation of violet, the three primary colors. Now if the elements of the first kind are wanting or paralyzed, there can be no perception of red, if of the second, no percep ion of green, of the third, no perception of violet. Accordingly there is red blindness, green blindness, and violet blindness. The last is quite rare.

In testing for color blindness, various methods have been used. It has been found, that it will not do, simply to hold up different colors and ask their names. Knowing the name of a color is a different thing from actually seeing it. The method proved to be the most accurate and simple, is that of Holmgren. Berlin worsted is the material chosen. It is better for several reasons, than bits of colored glass or paper. All the different colors are selected and five shades of each. This pile of worsted is laid on a table in broad day light. One skein is taken from it and laid by itself. The one examined is then asked to select from the pile those matching it, and lay them by the other. One not color blind will pick out quickly all the skeins that are alike, while the others will make the characteristic mistakes. The color chosen as a corresponding one, shows the class of color blindness to which he belongs. One is tested in turn for red, green, and violet, blindness.

If one feigned color blindness, to escape responsibility for a railroad accident, this examination would quickly reveal the deception. To avoid detection, he must be as familiar with the exact laws of the different classes of color blindness, as an experienced specialist, which would hardly be probable. Suppose, for example, the one feigning, understood enough of the subject to know there were different classes of this defect, and assumed red blindness, the most common form, and matched red with green or gray, imitating the ordinary mistakes. With a pure red this would be well enough. But show him magenta, a common red. This is not a pure color, but gets its special shade from an admixture of blue. One, really red blind, does not see the red in it at all, but does see the blue, and that only; hence he matches *this* red, with blue. To match it with green or gray, would reveal a deception at once.

One question of great importance in this subject, relates to the frequency of its occurrence; and the more accurate and scientific the tests, the greater the number of color blind found. After an examination of thousands of cases, in various countries, by different investigators, it has been found, that the proportion of color blind among men, is one in twenty-five, among women, it is very rare indeed.

Color blindness, like other traits, is hereditary, and runs in families. It bears no relation whatever to the color of the eye but is equally common with dark eyes as with light. Again, color blindness has no connection with errors of refraction, so that whether the eye is near-sighted, or the reverse, or has any other departure from the normal type, these defects need not be corrected in testing for color blindness. The eye may be sound and perfect in everything but color. One author reported remarkable visual power, as to the shape of objects, in many of his cases.

It is believed that the sense of distinguishing colors can be weakened or perverted by injuries, some diseases, and the excessive use of tobacco and alcohol. Of cases of acquired color blindness, those of the most interest, and the greatest frequency are caused by tobacco and alcoholic beverages, especially the latter. There is but one remedy—immediate and absolutely total abstinence.

THE AMERICAN GYNECOLOGICAL JOURNAL for March contains a paper by Dr. I. S. Stone on

The Significance of Pyrexia in Surgical Cases.

In his paper the author confines himself exclusively to the consideration of high temperature following abdominal operations. He points out that we may have a severe peritonitis with a temperature below normal and a pulse (which is generally more to be relied upon than the temperature) which may not be greatly accelerated. To the obstetrician, pyrexia is full of meaning. If there be rigors, with pain in the region of the uterus, with quick pulse and temperature anywhere over 100° or 101°, the patient is fortunate who obtains relief when her uterus is carefully cleansed of all septic matter. Observations made upon patients suffering with pelvic abscess often show a decided improvement, so far as pulse and temperature and even pain is concerned, after resting and using free purgation. After an abdominal operation, the patient's pulse, her countenance and voice, her ability to raise and move the abdominal walls in respiration, are all of value in determining the presence or absence of inflammation. If the temperature is not higher than 102° or even 103° on the evening of the third or fourth day after laparotomy, we may fully expect a recovery, if the pulse is of good quality, without reference to its frequency, provided the patient's bowels are open, and the stomach retains liquids. This remark, of course, applies only to completed operations, and does not include forlorn exploratory operations or even hysterectomy. There may be some reason for a temperature of 102° or 103° on the third to the sixth day, which may be easily explained. Very often the abdominal wound is infected in operations for pelvic abscess or dermoid cysts. In these cases we may expect to have suppuration in the wound with stitch-hole abscesses.

Dr. Augustus P. Clarke presents "Some Observations respecting Tubo-ovarian Disease." For the prevention of adhesions after the removal of the appendages, he suggests that the surfaces of the incised parts should be turned towards each other, or should be so coapted by means of aseptic buried sutures that there will not be left any abraided or inflamed tissue that can unite with other parts while union is taking place.

Dr. W. B. Sprague contributes a paper on

Electro-therapeutics in Endometritis.

He has treated, in all, one hundred and fifteen cases, of which forty-six were cured; that is, all the symptoms of endometritis disappeared for a considerable time and have not recurred to his knowledge. Fifty-four were considerably benefited, and eight were not benefited. In all cases of severely lacerated cervix, the disease returned unless the laceration was repaired as soon as all the symptoms were relieved, and a recurring retroversion was also always accompanied by recurrence of the endometritis.

Dr. M. B. Ward discusses the subject of

Peritoneal Irrigation.

Water left in the peritoneal cavity, he thinks, certainly does prevent the formation of early adhesions to some extent. It will also assist the gravitation of the omentum to its proper place in front of the intestines, if it has not been placed there by the operator. The water also helps to relieve the intense thirst that patients suffer from after an abdominal operation. The author also thinks that in some cases, water left in the peritoneal cavity has materially reduced the shock of the operation. He has never seen any harm from peritoneal irrigation.

Dr. Robert T. Morris contributes a clinical lecture on the subjects of Hysterorrhaphy and Appendicitis. Dr. F. Byron Robinson reports an "Operation for Ruptured Ectopic Pregnancy" where the patient's temperature before operation was 106.2°. The patient recovered. The remaining paper in this issue is "The Puerperium" by Dr. Mark A. Rodgers.

THE CHICAGO MEDICAL RECORDER for May is taken up principally with the consideration of the treatment of phthisis. Dr. Robert A. Babcock contributes a paper on

The Treatment of Consumption.

Subcutaneous injections of gold or iodine do good, he thinks, as do sterilized solutions of creasote or the inhalation of compressed air charged with antiseptic and healing vapors. To allay the cough, he advises the use of small fly blisters below the clavicle of the affected side. Codein is also of service. The food should be nitrogenous and easily digested, milk being the best. He does not believe in the use of cod liver oil, on account of its effect on the digestion. Quinine should be administered in tonic doses. Strychnia and arsenious acid are, in his opinion, very useful tonics and, if the pulse is rapid and feeble, he advises whiskey in moderate amounts. For individuals in the early stages he advises a change of climate.

Dr. Joseph M. Patton also contributes a paper on

The Treatment of Pulmonary Tuberculosis.

He advocates the use of the hypophosphites; the hypophosphite of soda being the most useful. He regards the compound syrup of the hypophosphites as harmful, following the teaching of Churchill in this regard. In advanced cases, he has found no mixture so efficient in quieting the cough and loosening the sticky mucus, as one-eighth of a grain of morphia with ten drops of dilute hydrobromic acid given in syrup of tolu. For the night sweats, atropine and camphoric acid are the most useful.

Dr. N. S. Davis, Jr., discusses the value of "Voluntary Respiratory Exercise in the Treatment of Phthisis." The exercises are contra-indicated when there are large cavities in the lungs and immediately after hemorrhage from the lungs, because forcible and deeper respiration may dislodge a clot and provoke additional hemorrhage. They will do little good unless tried in suitable cases and persisted in.

Dr. John A. Robinson also contributes a paper on "The Treatment of Pulmonary Tuberculosis."

Dr. George W. Emery reports a case of "Varix Mammary" in which death from hemorrhage followed puncture of the glands.

Other papers in this issue are: "The Medical Profession in Politics, by Dr. Arthur R. Reynolds; and "The Report of Milk Inspection in Chicago," by Dr. Adolph Gehrmann.

PERISCOPE.

NEWS AND MISCELLANY.

The next Annual Meeting of the Medical Society of New Jersey will be held in the West End Hotel, Asbury Park, on Tuesday and Wednesday, June 27th and 28th, 1893, commencing at 11 o'clock A. M. on Tuesday.

Summer Excursion Tickets.

To all Northern and Eastern seaside, lakeside, and mountain resorts, to Deer Park, and Oakland, the Virginia Springs, Niagara Falls, Luray Caverns, Gettysburg, and to all other points where people gather in search of health and pleasure, are now on sale at all Baltimore & Ohio ticket offices at greatly reduced rates. These tickets will be sold from June 1 to September 30, and are valid for return passage until October 31. Before selecting your route or resort consult B. &. O. summer excursion book, in which shortest routes and lowest rates, via "Picturesque B. & O." to all resorts are given from points on that road east of the Ohio River; profusely and artistically illustrated. This book can be procured free of charge upon personal application to ticket agents, B. &. O. R. R. Co., or you can have it mailed to you by sending name and address with 10 cents in stamps to Chas. O. Scull, Gen'l Passenger Agent, Baltimore, Md.

To the World's Fair Via B. & O.

GOING VIA WASHINGTON AND RETURNING VIA NIAGARA FALLS.

The Baltimore and Ohio Railroad has placed on sale at its offices throughout the East excursion tickets to Chicago, good going via Washington and returning via Niagara Falls, with the privilege to stop over at each point. These tickets are valid for return journey until November 15th, and are not restricted to certain trains, but are good on all B. & O. trains, and permit holders to travel via Pittsburgh or via Grafton. By either route passengers cross the Allegheny mountains, 3,000 feet above the sea level, amid the most picturesque scenery in America. Sleeping car accommodations may be reserved in advance upon application to nearest B. &. O. ticket office.

" **Stanford E. C. Chaille, Joseph Jones, A. W. de Roaldes,** . *NEW ORLEANS*
" **C. B. Brigham, R. B. Cole, Levi C. Lane, J. Rosenstirn,** . . *SAN FRANCISCO*

"Having occasion to investigate the question of wholesome beverages, I have made a chemical analysis of the most prominent brands of Champagne. I find G. H. Mumm & Co.'s Extra Dry to contain, in a marked degree, less alcohol than the others. I therefore most cordially commend it, not only for its purity, but as the most wholesome of the Champagnes."—R. OGDEN DOREMUS, M. D., *Professor of Chemistry, Bellevue Hospital Medical College, New York.*

NO OPENERS REQUIRED. In using G. H. Mumm & Co.'s Extra Dry in sick rooms and families.

CHAMPAGNE IMPORTATIONS. Custom House statistics of 1892 show G. H. Mumm's Extra Dry to be 75,880 cases, being more than one-fifth of the entire champagne importations and over 9,000 cases more than of any other brand. It is noted for its excellence, purity and natural dryness.

G. H. Mumm & Co.'s Extra Dry of the excellent 1889 vintage is attracting great attention for its natural dryness, purity and quality.

FRED'K de BARY & CO., New York,
Sole Agents in the United States and Canada.

VACCINE MATTER.

For the accommodation of our Subscribers, we will supply both Bovine and Humanized Vaccine Virus.

Guaranteed to be fresh and in every respect first class.

PRICES:

Bovine Crusts, - - -	**$1 50 each**
Bovine Points or Quills, -	**1.00 a dozen.**
Humanized Crusts, - -	**1.00, small.**
Humanized Crusts, - -	**2.00, large.**

The Humanized Crusts are warranted to be from typical cases, and in every instance from healthy children, with unquestionable family histories.

PLEASE ACCOMPANY THE ORDER WITH THE MONEY.

Address, The Medical and Surgical Reporter,

☞ **Nothing less than half dozen sold at these prices.**

CYSTIC GOITRE WITH CASES IN PRACTICE.

A. BRITTON DEYNARD, M.D., New York.*

DEFINITION.

Any enlargement of the thyroid gland containing a cyst.

CLASSIFICATION.

Clinically we meet single or multiple cysts. Where vessels predominate in morbid action we have vesicular or cavernous cysts. They contain sometimes pure blood. Where connective tissue increases, fibroid development takes place; producing the fibro-cystic formations whose contents in appearance vary from grumous to gray-looking serum.

Calcareous degeneration takes place in the cyst wall or septæ when multiple, but this is rare. As exophthalmic goitre, or Graves' disease, may accompany this and every form of thyroid enlargement, it is most probable they are only different manifestations of one and the same disease.

ETIOLOGY.

The cause, like that of goitre itself, is an unsettled problem. It is found in the frozen North and under the tropics. Humboldt mentions its prevalence in South America among those of most varied environments, as to soil and climate, and a recent traveler, Vincent, alludes to its prevalence there, particularly among the Venezuelians. Over sixty per cent. of the inhabitants of the Indian Punjaub are said to be affected with goitre. That it is due to a high percentage of magnesian lime in solution in the water cannot be maintained, That it may be a mycosis there is some reason to believe. Klebs suggests organisms. He sees a relationship in changes taking place in the enlarged spleen of intermittent, and goitre. No inflamatory change in vessels, but a lessened resistance pressure of vessel walls of spleen and thyroid gland.

PATHOLOGY.

The thyroid is a vascular, ductless, and true epithelial gland. There takes place a defective maintenance of structure, increase of fluids and organizable products, and oozing of coloring matter. Colloid metamorphosis occurs in cell contents and then it liquifies. Virchow thinks that colloid of this gland commences in the free fluid of its follicles after having been let loose by the destruction of the cells. Cell walls atrophy and connective tissue forms capsule or capsules of cyst or cysts. Hemmorrhage occurs which colors contents of cysts, and hence fluid is generally grumous in appearance. Under the microscope are seen detritus, fatty degeneration cells, and cholesterine. Albumen is always found in cyst contents, and according to Conheim[1], the thyroid is the typical seat for the development of the so-called alkali-abumen; albumnose and meucin. Cysts may develop in cases where little colloid degeneration is seen.

*Instructor Post Graduate Medical School, Assistant Surgeon Manhattan Eye and Ear Hospital. Fellow of the Academy of Medicine, etc.

1 Conheim's Pathology.

Follicles are distended by albuminoid fluid, and cells undergo changes. Fatty degeneration most common.

SYMPTOMS AND DIAGNOSIS.

The symptoms depend on the presence of tumor and the pressure made by it. The most common fibro-cystic have irregular outlines, firm consistency, and fluctuating cysts. Dyspnœa is present generally, but size of growth does not always determine its extent. Pressure on veins may lead to passive hyperæmia of the brain and tidal tinnitus is sometimes present, anæmia constant and prominence of eyes sometimes. It is generally seen in young women, and a hypodermic syringe, used as an exploring needle and aspirator, makes diagnosis easy. The presence of so marked an enlargement over the thyroid region and such an assemblage of symptoms could only be confounded with an aneurism or malignant growth. The former does not move vertically during deglutition and after cysts have formed in cancers, evidence of the disease in adjoining glands would present itself.

TREATMENT.

The methods used in the following cases will best elucidate the principles underlying plan of treatment adopted, and found effective.

Case I. Miss O., æt 30, housekeeper, was seen in June, 1889, with large globular growth in median line of neck over thyroid region, and extending on both sides as far as the carotid vessels. Patient was lymphatic temperament, anæmic and suffering from dyspnœa. A hypodermic needle passed through the centre of the enlargement revealed the presence of a fluid cavity, and the syringe used as an aspirator brought out some dark-looking fluid which did not coagulate on exposure to the air. Tr. Iodine, which in the experience of the writer had been so effective in the treatment of simple hyperplasia of the thyroid was injected (10 m.) into the lateral lobes several times during the summer, and while it lessened the lateral lobes in size, it did not relieve the dyspnœa or reduce the central enlargement. In October following, a seton passed through the cyst entrance and exit about two inches apart caused considerable reaction; temperature 103.° At the end of ten days, patient was put to bed, and suppuration around cord enabled one to pass a small trocar and canula. Through canula retained in position, injection of sol. acid carbolic was used frequently. At the end of ten days, constitutional disturbance had ceased. The seton and canula were removed and a drainage tube introduced. This treatment was kept up for six weeks when tube was removed. The discharge continued of pus for seven weeks and it was feared a permanent fistula would result, but healing in a month occurred. The cyst prominence almost entirely disappeared, the dyspnœa was relieved, but the patient passed out of sight and therefore the ultimate result cannot be stated.

Case II. Miss S., student, æt 22, brunette, family history good, presented herself July, 1890, with large growth over thyroid region more marked on right side. Patient had pallor and dyspnœa. It was stated cyst had been tapped and quickly refilled. From the irregular form, hard and heavy fibroid formations were suspected and afterwards confirmed. Drew off with the aspirator a tumbler full of grumous-looking fluid. At the end of a week it was refilled. Cocaine was injected under the integument over the cyst, and an incision severing tissues made. When the dark-colored thyroid gland was exposed a double corded silk seton was passed and repassed through the cyst wall. Entrance and exit a half inch apart. The ends of the seton strands were separated and tied about six millimeters apart on either side with a view to cut off circulation in enclosed space. Inflammatory symptoms followed and temperature went up to 104° on the third day. The space enclosed was now divided; no hemorrhage following. The phenic acid solution for irrigation was used and temperature fell to normal gradually during two days. The opening was kept up with two large drainage tubes, and the cyst cavity healed up, after four weeks, from the bottom. The dyspnœa and central enlargement disappeared, but the lateral lobes continued hypertrophied. Tr. iodine injections subsequently reduced the size of the lateral lobes somewhat, but whether from infrequency (5 times) or from inefficiency I am unable to state. At the present time, over the situation occupied by cyst, depression appears and patient is pleased with result of treatment.

Case III. Miss G., æt. 28, dressmaker, active and intellectual, applied in October, 1891, for relief from deformity and dyspnœa. Patient was cachectic, anæmic and the eyes prominent. There was a large growth over the region of the thyroid isthmus. Patient had been treated for three years off and on with the iodides. A hypodermic needle determined the contents of a cavity in growth and the contents shown by aspirating consisted of a liquid resembling serum and blood. After a hypodermic of cocaine as in the last case, a bistoury was used and cyst opened as if it were an abscess. The hemorrhage was profuse, but venous in character, and easily controlled by packing the cyst cavity with borated cotton and compress. The second day this was removed, and the bleeding which was free quite ceased after applying saturated solution chromic acid to cavity and repacking. There were no constitutional symptoms and my associate Dr. J. H. McCullough, who assisted and attended to subsequent treatment, informs me that suppuration hastened by poultices took place, and healing as desired. I saw the patient one year after. The growth was not apparent; the patient much improved in health and grateful for treatment.

Case IV. Miss H., æt. 20; student; was first seen June, 1888, with simple parenchymatous goitre of medium dimensions. A hypodermic of tr. iodine in six weeks reduced the thyroid to normal size. In October, 1891, patient presented herself with large growth over the thyroid region. She was very anæmic, eyes protruding, and had dyspnœa and stupidity. The presence of a liquid cavity was determined with the hypodermic syringe, and its contents shown to resemble grumous fluid. Cocaine was used and an opening made down to the cyst wall. This was opened with bistoury. Hemorrhage was copious, but with fingers in wound somewhat under control. Adjoining cysts to the one opened were determined upon and septæ severed. Packing with cotton and compress stopped bleeding. The second day chromic acid was applied to the inside of cavity repacked. No constitutional disturbance followed and my associate Dr. J. H. McCullough, who was present and attended subsequently, reports no incidents of importance. I saw patient one year after and the central enlargement had disappeared. There was no prominence of eyes nor dyspnœa. The general health of the patient was greatly improved. The lateral lobes were somewhat enlarged, but the results were satisfactory to the patient.

CONCLUSION.

It is quite unnecessary to state that the dangers of such treatment was made known to the patients. They were undertaken as a duty rather than as an anticipated pleasure. All the precautions that go along with modern surgery: cleanliness, etc., were observed as far as practical. Prof. Depuis reports cases treated with trocar, canula, and tr. iodine. Canula left no wound while healing. Billroth reports a death from suppuration and septicæmia after injection of alcohol. With an open wound there is less danger from septicæmia, and it is more under control. Incision is to be preferred to excision of the cyst owing to difficulties attending the operation and dangers following, such as shock, etc. Removal of gland is condemned by more recent writers owing to the danger of a development of a condition first described by Sir Wm. Gull, and afterwards by Dr. Ord named myxœdema. A state in which meucin is developed in the connective tissue, and higher phychological centres become less responsive. This is, doubtless, the cachexia strumipriva of the German writers. The few cases of myxœdema seen by the writer resembled forms of cretinism. Cutting out a portion of the isthmus of the thyroid, first practiced by Sidney Jones, is said to be efficient treatment, but in those cases the anatomical identity of isthmus could not be recognized, owing to degeneration malformations. The hemorrhage is free, but except in hæmophilia under control with the packing and caustic as described. That there is danger from air and blood clot entering the veins there is no doubt, but in all surgery involving veins of the neck the risk can be lessened by pressure below the seat of incision. It is said that that those who follow the service of the gynecologist or the ophthalmologist learn how much traumatism the abdomen or the eye can stand, and it is hoped from a perusal of this paper some reader may better estimate how much meddling the cyst of the thyroid in some cases will stand with benefit to their possessors.

COMMUNICATIONS.

EPILEPSY.*

H. D. HOCKENBERRY, West Sunbury, Pa.

In the preparation of a paper upon any scientific subject, the means afforded to this end are first, the recorded experience of others who have made the subject in question a careful study; and second, the personal experience of the writer.

To prepare a compilation of what others have written is often, not only to destroy the original and interesting style of the several writers; but even their expressed thoughts may be so contorted as to be destroyed beyond recognition. The personal experience of a country physician can not add much of value to the literature of this disease, because from its very nature there cannot be that careful supervision of a sufficient number of cases, upon which to base a theory and method of treatment.

It seemed to me better, after consulting all the subject matter available, including personal experience, rather to discard all this and branch off into the realm of the speculative, giving you that which the thoughts of idle moments has suggested as to the nature of this disease; and which, if of no practical value, at least has the merit of originality, and can be productive of no harm, by reason of the absence of any proposed experimental treatment.

Epilepsy is not one of the "New Diseases." For aught known to the contrary it may be as old as man himself. At least it will be no trouble to find those high in authority who would ascribe this to the indiscretion on part of Adam and Eve in eating of the "forbidden fruit." From ancient writers, we learn that this complaint was well known, and at a time when "spiritual agencies" were believed in as productive of diseases, the convulsive contortions of the epileptic were thought to be due to the presence of a devil that had gained possession of the afflicted and hence called "Morbus Dæmoniacus."

And when spirits good and evil were thought to be the ruling factors in all the actions of mankind, it certainly required no stretch of the imagination to accept such theory. To see one apparently in the enjoyment of good health, possessed of all the vigor of physical and mental activity, suddenly, without warning, seized with a convulsion; the sardonic grin, the rolling eyes, frothing at the mouth, the jerkings of the arms and legs, all seemed more like the work of a devil, than that it were due to any physical cause or pathological change. Oft times it cast him into the fire and oft times into the water; certainly nought but an evil spirit could thus torment man.

It is said to have been the custom for those present, when one was fallen into a fit, to spit upon him, or into their own bosoms and thus avert the evil from themselves. From which custom arose another of the many names this disease received, "Morbus Qui Sputatur."

In the years that have brought with them such advancement in general knowledge, and medical knowledge as well, pathology has perhaps nothing much better to offer, than this theory of demoniacal possession. And the therapeutics of the present day are not more successful, than when the priesthood, by their incautations, attempted to drive out the devil.

Epilepsy has seemed to me to bear such an analogy to immoral habits or vices, as to be called a "fit habit." Man is a creature of habit. What he did yesterday he is likely to do to-day, and still more likely to repeat to-morrow. Past surroundings and circumstances are predisposing causes to a certain line of action; present surroundings and circumstances exciting causes, and in turn become predisposing causes to direct future actions. And, not only is this true as regards the individual himself, but it has its influence upon his offspring in impressing upon them a tendency to certain moral characteristics or pathological weaknesses.

In ethics we call such inherited tendency, "original sin." In pathology, "hereditary predisposition to disease."

*Read before the Butler County Medical Society, April 18th, 1893.

The passionate man, if the falling into a rage be looked on as in some of the other vices, is to be pitied rather than condemned, and is a proper subject for a course of medical treatment.

Born into the world with a predisposition to this vice, educated by parents who may be are themselves afflicted with this moral disease, he is certainly most unfortunate in his surroundings and a very pitiable object. With no power of self-control, the most trival opposition throws him into a fit of anger, during which his words and actions are those of a lunatic, rather a sane man.

According to the present status of physiology and also pschycology, we are taught that the various functions of the body and mind as well, are represented by centres of gray nervous matter, the irritation of which is followed by a corresponding act, physical or mental. A predisposition to immoral habits is that condition of the nerve centres of emotion, of passion, of appetite, that renders them abnormally susceptible to impressions, so that they are easily stimulated to action. But the predisposition alone will never excite these centres. There must be an exciting cause, some impression carried through the medium of one of the nerves of special sense producing a consciousness, say of resistance or opposition, and this irritates the emotional centres, and a spasm of rage results. The fierce expression of countenance, the clenched fists, the gnashing of the teeth, the loud voice, the emphatic language are characteristic phenomena.

After such an attack there follows a period of depression or quiescence, familiar to those who have indulged themselves in this habit. Then a return to the ordinary state of moral equilibrium with this exception, the emotional centre is left with an increased susceptibility to respond to inhalation. That is, this first indulgence in rage has added to the predisposition, and a second is more easily excited. Each rendering the individual more and more susceptible to resent opposition, until the predisposition becomes so marked that the ordinary opposition man meets with in every-day life is sufficient to throw him into a rage. He has become a confirmed victim to this habit, and it is hardly possible to place him under conditions so favorable that he will not come in contact with something irritating. But not this vice alone, that has been used as an illustration, but of all others, the history is the same; the congenital predisposition, the first indulgence, the increased predisposition, until the man becomes a slave to vicious habit, with no strength to resist the promptings of his evil nature, that is, the impulse sent out from a perverted nerve centre.

Such an one has not acquired any new powers of mind or body; it is but a perversion of his normal attributes; a disordered function of certain centres of nervous matter that are the seat of psychological acts. So with a class of physical diseases to which epilepsy belongs; there is no change in tissue structure, but a perversion of the functions of normal tissue, of nerve centres that generate, that direct, that co-ordinate motor impulses. Epilepsy is a functional and not an organic disease. As yet, no characteristic morbid change of tissue has been found to accompany this. It is not probable the time will ever come when its morbid anatomy will be known—when, by microscopical examination or chemical analysis, there can be detected that difference in nerve-cells by which is distinguished a greater or less power of receiving or generating nervous impulse.

Epilepsy is a "fit habit." The motor centres have from time to time indulged in independent, irregular and meaningless actions, prompted by some reflex irritation, until such motor debauch has become habitual. There has been, perhaps, in most cases, a hereditary predisposition; an inherited tendency from parents who have been afflicted with one or more of the various neuroses of body, or who have been slaves to immoral habits of passion, emotion, or appetite. These bring children into the world with a predisposition to one or more of the various neuroses or vices. It may be epilepsy, it may be dipsomania; it may be kleptomania.

How true it is that the iniquities of the parents are visited upon the children! But what a consolation to those possessing this inherited weakness, to know that if the exciting cause be avoided, the predisposition goes for naught. No difference how much of old Adam is born in us, we have but to resist the exciting cause in the temptation to do evil, and we escape condemnation.

No difference how many friends have died of hereditary disease, say of tuberculosis, father, mother, uncles, aunts, there was in everyone of these cases an exciting cause; exposure, fatigue, a lowering of the standard of health. Avoid this and the fatal disease is escaped.

In the child predisposed to epilepsy, there is an abnormal susceptibility of the centres of motion, so that these when irritated send out a motor impulse to the various muscles of the body exciting them to contraction. As the emotional centres should be under the directing and controlling power of the will, so the centres of motor impulse should be under the control and direction of co-ordinating and distributing centres. And as the emotional centres may act independent of the will, as is seen in the excitement of rage; so the motor centres may act independent of the co-ordinating and distributing centres and a convulsion result.

The exciting cause is an impression carried to the motor centres through the medium of an afferent nerve. It may be the presence of worms, or undigested food in the alimentary canal, irritation of the sexual organs; any such acts as an irritant, the impression is carried to the motor centres and produces that phenomena, called a fit. One fit predisposes to a second, a second to a third and so on until even though the original exciting cause has been removed, the susceptibility to reflex influences has become so marked that the ordinary acts of nutrition are sufficient to excite to convulsion.

The individual has become an epileptic.

But while the predisposition to epilepsy is most often inherited, it may be acquired. In infancy and early childhood the actions are chiefly automatic.

There has not been a development of the "co-ordinating" and "distributing" centres to that degree but that a reflex irritant may easily disturb the normal equilibrium of the motor centres and produce a convulsion.

The irritant must necessarily be more powerful than when there is an inherited tendency; but the convulsion that follows predisposes to a repetition of this. The medical profession should have this fact clearly in mind, and when called to see a child taken in convulsion, not treat it as a light matter, because there is no immediate danger to the child. A convulsion is never a trival affair, and it should be impressed upon the minds of the parents, that its gravity consists in the danger of such becoming a habit; thus rendering the future of the child one of great misery. And that to avoid this the most watchful care should be exercised over its habits and surroundings, its food, clothing and education. It is not true that every child that has a fit becomes an epileptic, neither is it true that every young man who gets drunk becomes a drunkard. Yet who would not have the greatest solicitation regarding a son who had thus indulged in strong drink, and would use the utmost care to avoid a repetition of such debauchery, knowing that in this is the only safety.

Prevention is better than cure. To bring that degree of intelligence to bear upon the development of the child so as to protect the susceptible nerve centres will not only ward off physical disease but moral disease as well. As the physician is not usually consulted about such hygienic principles until some one has suffered because of their violation, when called to treat the convulsions of infancy and childhood, not only should he administer the necessary drugs, but the far more necessary admonition as to the proper bringing up of the child. Too much can not be said upon this part of the therapeutics of epilepsy. To my mind this, and this alone, is the road to successful therapy. It must be preventive. Why is it not more generally understood that one fit, except as a predisposing factor, is as independent of a second as one attack of pneumonia is of a subsequent attack. How often is the question asked! "Why can doctors not cure epilepsy, asthma, sick headache?" That is, give a treatment that will prevent a recurrence of the attacks. When called to treat a patient with pneumonia, the physician has done his best by the patient when he has seen him restored to his former status of good health. Dismissing him with instructions to use such care in the future as to avoid all exposure lest he be again attacked with pneumonia. So with epilepsy, sick headache, asthma, when a paroxysm is past and the patient restored to his usual health, the skill of the physician has accomplished all that is possible in the way of medical treatment.

The recurrence can only be prevented by the avoidance of exciting causes.

A peculiarity of epilepsy and also sick headache, which is of near kin, is that following an attack of sickness there is a period, when exposure to those influences which have brought on an attack, may be indulged in with impunity. The writer, speaking from personal experience says, "that while the indulgence in good living is very likely to be followed by sick headache, at no time can he so safely eat of the richest food, as the day following a headache."

This is but additional evidence of the analogy to immoral habits. The safest time to oppose a passionate man is after he has indulged in a fit of anger. The drunkard is most able to resist temptation after recovering from a debauch. The libertine most virtuous after a period of sexual indulgence.

The reason of this is quite apparent. The centres of emotion, of appetite, of motor impulse having for a time been unduly stimulated, are in a condition of exhaustion, and what seems to be resistance is after all but a lack of strength to respond to the stimulus.

Could such a state be kept up, it would be an easy matter to be virtuous and to be temperate.

But of what value is all this speculation as to the nature of epilepsy, if it suggest no treatment for its relief. The preventive is all very well but it can offer no comfort to the sufferer, who has become a victim to the fit habit. Is there no treatment to relieve a condition that is worse than death itself; that renders the individual miserable, unfits him for the activities of life or the enjoyment of any of its pleasures? If there be an analogy in this to immoral habits, as I have tried to show, may this same analogy not extend to treatment as well, and that which will cure an immoral habit suggest a treatment for a pathological habit?

Let us take for example the man addicted to habits of intemperance. The popular treatment for this at the present time is the "Keely Cure." And if there be in this what is claimed for it, why may it not cure other habits as well, both moral and physical. If the "chloride of gold treatment" be not a myth, then man has indeed discovered a means by which he may "be carried to the skies on flow'ry beds of ease." A willingness to submit to treatment, and the use of the hypodermic syringe very much simplifies the plan of salvation.

But what is the rational treatment for habit? Man possesses the attribute of will; a characteristic by which he is distinguished from the lower animals; an attribute by which he may direct his actions independent of his surroundings. If this be properly developed, it controls his emotions, his passions, his appetite. No difference how aggravating the circumstance or the opposition he meets with, by the proper exercise of his will, his emotions are controlled and his temper unruffled. No difference what the temptation to depart from virtue may be, if man be true to his nature, he resists the wiles of the siren "charm she never so wisely." Resistance to temptation is the only rational, the only sure cure for vice.

The exercise of the will in such resistance increases the strength of this attribute, until in time the tendency to sin is very much lessened, the habit held in abeyance. It may be the habit has been so long indulged in, there is not left sufficient strength of will to resist temptation. For such individual there is no hope, except he be placed in an asylum where all means to gratify his evil cravings are wanting; so that the absence of indulgence will in time lessen his desires and allow the will power to gain its ascendency. But not only abstinence from the indulgence of the propensity in question, but from all others. The drunkard who wishes to reform must not only abstain from the intoxicating cup, but he must abstain from anger, lust, etc., as these weaken his will power and lessen his strength to resist the craving for strong drink.

The epileptic should be treated as one without power to resist the fit habit. If not placed in an asylum, should be under the care of one who sees that the patient is not exposed to those exciting causes that bring on a fit. Every such thing should be avoided. The habits of the patient looked after most carefully, remembering that everything that tends to weaken the controlling centres, strengthens the fit habit. Indulgence in anger, in strong drink, in lust, in gluttony, all predispose to a recurrence of fits.

Very often the friends of an epileptic, through a mistaken sense of kindness, indulge him in all his whims, when it is very essential that he should be taught habits of self control. The epileptic is so often addicted to gluttony, to self abuse, irritable in temper, it seems but a natural consequence that when the controlling power is weakened by one bad habit, others should follow. The cure of one is but accomplished by curing all.

There is no specific treatment for epilepsy. It can only be successfully treated by the removal or the avoidance of every thing that may act as an exciting cause in bringing on the convulsions; thus allowing the coordinating and distributing centres of motor force to become sufficiently strong to control or modify motor impulses. The avoidance of every thing that tends to nervous excitement. To no class does the admonition "Be temperate in all things," come with such force as to the epileptic. Temperate in eating, in drinking, in exercise of both mind and body. Total abstinence from all things not essential to the physical well being. It would be well for epileptics, could they be placed in an asylum removed from all the exciting cares and worry of the world, as well as the temptation to indulge in its pleasures.

But is there nothing in the way of drug medication of value in the treatment of epilepsy? Not as a specific. And by such you understand, a treatment that will remove the predisposition to fits. As in scientific investigations it is well for us to recognize the unknowable that we waste no time in vain search after such hidden things; so in the practice of art, we should recognize the impossible, and not attempt impossibilities.

To attempt to remove predisposition to disease would be as hopeless a task as to undertake to get rid of "original sin." "What can not be cured must be endured." And to ward off the evils of predisposition, avoid the exciting cause.

In the treatment of epilepsy, each case met with must be studied separately and treated as the indications suggest. If there be a condition of debility, tonics, medicines to aid digestion, the careful selection of a nutritious diet. If the excretory glands be sluggish, suitable agents to stimulate these. In fact whatever is necessary to bring the general health of the patient up to its proper standard is treatment for epilepsy. What about the use of the "bromides" in this treatment? You will certainly be disappointed if you depend upon the prolonged use of these to effect a cure. For a time these seem to control the fits; but afterwards they loose this effect; and the last stage of the patient is worse than the first. These control convulsions by stimulating that exhausted condition of the motor centres that follows a fit; but the controlling centres are also weakened in the use of these and the result is while the fits may return with lessened violence their frequency is increased.

The bromides may be useful at times of nervous excitement, as for example during the menstrual period, but their use should not be long continued, because of the effect upon digestion, upon the blood, and upon the nutrition of the brain. For other so-called specifics, the same may be said; at certain times or under certain conditions they are useful; but to give to every patient indiscriminately and keep up their administration indefinitely must result in great harm.

When may an epileptic be considered as cured? When would you consider a drunkard cured of his drunkenness? Is it not true that "eternal vigilance is the price of safety;" and let him that thinketh he stands take heed lest he fall? As the time never comes to the man who has been addicted to intemperance that he may become careless when exposed to temptation, neither does it come to the epileptic when he may neglect the observance of proper hygienic precautions. It may have been one year, it may have been ten years since a fit occurred, each year lessening the danger of return; but never the time that this is altogether removed. In a certain sense an epileptic is cured when he has recovered his usual health after a convulsion; but in that the danger of recurrence is removed, he is never cured.

He was a Dentist.

Polite Waitress—"Tea doctor?"
Doctor—"No, coffee, if you please."
Waitress—"Roast beef, doctor?"
Doctor—"If you please."
Waitress—"Corn, doctor?"
Doctor (indignantly) — "No, madam, I am a dentist."

REPORT OF A CASE OF DETACHMENT OF THE LIGAMENT OF THE PATELLA. TREATMENT BY SUTURE. RECOVERY.

WILLIAM BARTON HOPKINS,* M. D.

Last November a large healthy man, forty-five years of age, was admitted to Episcopal Hospital. He had stumbled and fallen, striking his right knee with great violence upon a cobble-stone. Examination of the joint revealed a change of its natural contour. It was flattened anteriorly, and on flexing the leg upon the thigh, the form of the condyles of the femur became clearly exposed. There was a moderate fluctuation from effusion. The entire patella could be felt and seen drawn well up the thigh. No fragment of bone could be detected above the tuberosity of the tibia. As it was, therefore, evident that the patella had been torn away from its ligament, it was decided to open the knee-joint at once. The patient was etherized, and after preparation of the parts concerned the seat of injury was laid bare by a longitudinal incision it front of the joint about seven and a half inches in length. Not only was the condition of affairs looked for found, but in addition to the detachment of the ligament from the patella, the whole fibrous covering of the latter was found to have been ripped off and to have remained attached to the ligament. The patella was readily brought down to its natural position between the condyles, and but for its bare anterior surface was found to be intact. Very complete and durable coaptation was effected by the introduction of eight interrupted silkworm-gut sutures at the following points: Three king sutures upon which the greatest reliance could be placed were carried through three small drill holes at the apex of the bone uniting it with the stump of the ligament. The upper margin of the aponeurotic hood was then attached to the fringe-like fibres of the tendon of the quadriceps extensor with which it has been continuous, while its lateral margins were sutured through drill holes on either side of the patella. As all of these silkworm sutures passed through either holes drilled in the bone or through a very stout tendon, the approximation of the parts was not only snug but very strong. After thoroughly cleansing the knee-joint the long wound was closed, catgut drain being placed in its upper and lower angles. A liberal gauze-dressing was applied, and a long posterior splint retained to the limb. Three days afterward the dressing was removed on account of a slight rise in the patient's temperature, but it was found to be quite dry, except at the points of drainage, where a few drops of blood-stained synovial fluid escaped. The joint was free from redness, fluctuation and pain. In a month the patient was allowed to get into a wheeled chair. The natural contour of the joint was entirely restored.

Five months after the accident he was allowed to begin to flex the knee with considerable force, and it is interesting to observe that almost all the motion he now has, has been acquired within one month. As will be seen, he walks without a limp, and his limb has almost completely regained its strength. The patella is felt to be freely movable, and there appears, therefore, to be no obstacle to the restoration in a short time to the normal function at the joint.

So far as I can learn, sixty-six cases of rupture of the ligamentum patellæ have been reported. This number includes detachment of its upper and lower extremities as well as ruptures in its continuity. Of these I have had an opportunity of referring to fifty-five, including thirteen cases which were collected by Dr. Sands from the records of four hospitals in the City of New York.

In all the cases where treatment was employed, some appliance appropriate for fracture of the patella was used with results stated to be fair or good, save three. In two of these the kneejoint was opened and the parted ligament sutured to some fibrous tissue attached to the tuberosity of the tibia, by Sands of New York, and to a similar structure at the apex of the patella by MacFarlane, of Toronto, with excellent results. In both these cases silver wire was used. In the third case operated upon, the stump of the ligament and some fibrous tissues at the apex of the patella were

* Surgeon to the Episcopal Hospital, Philadelphia.

scarified long after the occurrence of the injury, but no sutures were used.

Two very remarkable cases are reported by Mr. Shaw, of London, of simultaneous rupture of both ligaments. In one, both ligaments were detached from the apices of the patellæ, while in the other case both parted from their insertions in the tuberosities of the tibiæ.

While, technically, even a very minute fragment of bone remaining in contact with the detached ligament would, if the separation occurred at its patellar extremity, constitute a fracture of the latter, a similar condition at its tibial insertion could hardly be classified, without causing confusion, as a fracture of the tibia. It would, therefore, seem proper to class such an injury as rupture, or, I think better, as detachment of the ligament, if a greater part of its rent surface is tendinous, not bony.

In a very large proportion of cases recorded, the lesion was caused by muscular violence. The case now reported I incline to attribute to the combined forces of direct impact and muscular contraction acting simultaneously; the cobblestone forcing the apex of the patella backward, while the tensile strain was applied by the muscles of the thigh. I do not think that the tendinous covering of the bone could have been stripped off by either direct violence or muscular contraction alone. Regarding the advantage in operating at once or at a latter period; if opportunity for the former offers, I see no reason for delay, provided there is no severe bruising of the soft parts adjacent, for the inflammatory reaction from the mere rupture is in most cases noticeably slight, and coaptation can be far more satisfactorily effected before, than after adhesions have formed.

As the special feature of this case is the stripping of the bone, it would be of great interest to know if a similar injury had ever happened before, but as its existence could not be revealed except by operation, whether it is unique or not must remain a matter of conjecture. While it might have added to the risks of necrosis of the bone, from impairing its blood supply, had suppuration occurred, it certainly aided materially in securing an approximation well equal to resisting any accidental strain that might be put upon it during the process of repair.

SOCIETY REPORTS.

AMERICAN MEDICAL ASSOCIATION.

Forty-fourth Annual Meeting, held in Milwaukee, Wisconsin, June 6, 7, 8 and 9th, 1893.

TUESDAY, JUNE 8TH,—FIRST GENERAL SESSION.

The Association met in the Academy of Music, and was called to order by the Chairman of the Committe of Arrangements, Dr. U. O. B. Wingate, of Milwaukee, at 11 A. M.

Divine blessing was invoked by the Rev. Henry T. Secrist, of Milwaukee.

On the platform were Drs. H. O. Walker, of Detroit, First Vice-President; Ernest Hart, Editor of the *British Medical Journal*; and Jesse Hawes, of Greeley, Colorado, Fourth Vice-President.

Dr. Wingate introduced His Excellency, Geo. W. Peck, Governor of Wisconsin, who delivered an

ADDRESS OF WELCOME.

He said he was delegated by a million and a half of people of Wisconsin to bid the Association welcome, which he did with pleasure. Wisconsin was a state where there was no need for any one to be sick, where there was no need for cemeteries, except to bury people who came there from other states with diseases that Wisconsin had not had time to cure.

Ex-Mayor P. J. Somers welcomed the Association on behalf of the citizens of Milwaukee.

Dr. Wingate presented President Hunter McGuire, of Richmond, Va., with a gavel with a silver handle and a body made of brick, representative of the solidity of the institutions and industries of

*Notes from special correspondent to THE MEDICAL AND SURGICAL REPORTER.

the city. Its color was representative of the Cream City of the Lakes, and its borders were studded with pearls taken from Wisconsin's rivers.

He then introduced the President of the Association, Dr. McGuire, who delivered the

PRESIDENT'S ADDRESS.

He said:—Our prime object is to study the origin of disease, the immediate occasion of its outbreak with the means of preventing it, and the best means of loosing its malignant hold if once fastened upon the individual or the community.

Regarding the membership of the American Medical and allied associations, he said we cannot too highly estimate the importance of attaining the greatest degree of excellence possible in the various independent organizations that were here represented. This could be more effectually obtained through the state and local societies that were in active and friendly relations with us. The state societies should strive to induce their members to form societies in every county of their respective states, in all cities of the same, and in all townships, or parts of counties where there was a sufficient number of physicians to justify such organizations.

Relative to the revision of the code, he thought it should be referred to the several state medical societies entitled to representation at the meeting, and that these societies should report their action to the annual meeting of the association. This would give us a fair expression of the opinions of the representative societies from all parts of our country and every reputable American practitioner of medicine would have an opportunity to vote on the subject.

President McGuire then referred to police regulation of small-pox as a matter for the gravest consideration upon the part of the general government and of the several states of the Union.

Quarantine was also considered.

In closing he touched upon a National Board of Health, and said its necessity would be appreciated when it was remembered that our present laws referred almost entirely to quarantine in time of epidemics, or threatened epidemics, such laws being carried into effect by the Marine Hospital Service through the Treasury Department. He learns that there will be organized movements to secure legislation by Congress on the lines indicated. He therefore suggested that a committee be appointed to cooperate with the Committee appointed by the American Public Health Association and with committees of other important bodies interested in securing the legislation needed.

On motion of Dr. Scott, of Ohio, the President's Address was referred to a special committee to report on the suggestions contained in it.

President McGuire then introduced Dr. Ernest Hart, who made a few timely and exceedingly appropriate remarks.

Next in order was the report of the Treasurer, Richard J. Dunglison, of Philadelphia. The report was read by Secretary Atkinson, which showed a balance in the treasury of $5,844,78. On motion the report was received and adopted.

The report of the Secretary was called for, and read by Secretary Atkinson. On motion the report was adopted.

The President called for the report of the Rush Monument Committee, but Dr. Geo. H. Rohe, of Catonsville, Md., asked for further time, which was granted.

Secretary Atkinson read the report of the Secretary of the committee on Public Health, in the abscence of the Chairman, Dr. Comegys, of Cincinnati. The committee was given a full hearing by the Congressional Committee. The Chairman of the Senate Committee, while willing to extend the powers of the existing quarantine office, did not think it possible to get an appropriation for its establishment. The members of the House Committee favored such a department, but the session adjourned without action. The best course, the committee thought, was an appeal to President Cleveland that he recommend the matter to Congress in his next annual message.

Dr. J. B. Hamilton, of Chicago, moved that the report be adopted; that it be printed in the journal of the Association, and that the committee be continued. Carried.

The report of the committee on Pan-American Medical Congress, was read by Dr. Charles A. L. Reed, of Cincinnati, Secretary-General of the Congress. The committee reported that every State in the Union, South America and Hawaii would be represented, and that everything pointed to a successful meeting. On

motion the report was adopted, and a vote of thanks extended to the committee for their efficient work.

The election of the Nominating Committee was accomplished, the Association adjourned until Wednesday, 11 A. M.

SECOND DAY, WEDNESDAY, JUNE 7TH—GENERAL SESSION.

The Association was called to order by the President at 11 A. M.

The Chairman of the Committee of Arrangements announced the receptions for the evening.

The President announced as the Committee on his Address, Drs. J. F. Hibberd, of Richmond, Ind.; C. A. Lindsley, New Haven, Conn.; W. T. Bishop, Harrisburg, Pa.; T. P. Satterwhite, Louisville, Ky., and Nicholas Senn, Chicago.

The Permanent Secretary announced the Committee on Nominations, thirty-four States being represented.

The Permanent Secretary also read invitations for the next session to be held at Asbury Park, N. J., and from Hot Springs, Ark., which were referred to the Committee on Nominations.

On motion it was resolved, that in view of facilitating the work of the sections and in the general interest of the Association, the election of officers of the Association shall take place on Thursday, and that after Thursday no Executive business shall be transacted at the general session of the Association except in accordance with a recommendation of the General Business Committee.

Dr. H. A. Hare, of Philadelphia, Pa., read the Address on General Medicine. He selected for his subject "A Brief Review of Some Practical Advances in Medicine and Therapeutics."

The author confined himself to the presentation of certain broad facts illustrative of the present status of the non-surgical phases of advance in medicine. The increased scope, variety and accuracy of diagnostic examinations no longer leave the practitioner any excuse for empirical treatment of a disease on general principles. He said supposedly specific ailments were being recognized as merely symptoms of the real causative and, therefore, curable distemper. A particularly instructive example of such evolution in the art of symptomatic diagnosis was cited in the case of anemia, so-called. Neither under the comprehensive title "impoverished condition of the blood," nor as the assumed result of disease in the blood-making organs, has there been warrant for empirically dosing with iron till the patient's teeth were discolored or with arsenic till he felt as though his back bone were a crow-bar; but when, with adequate microscopical devices, it became possible to count and measure the decrease and increase of the blood corpuscles in number and size, then a basis for the test and proof of the value of arsenic in pernicious anemia and of iron in chlorosis was found.

Mr. Ernest Hart, of England, was announced to deliver his Address on Cholera on Thursday at 11.30 A. M.

The Permanent Secretary read a report of the Librarian in which it was recommended that the terms of transfer of the library to the Newberry Library at Chicago be left to the Board of Trustees and the librarian, with power to act, and that such action be final.

On motion, the report was received and the views relative to the library were adopted.

Dr. Henry D. Holton, of Vermont, Chairman, read the report of the Committee on Revision of the Constitution. The report has already been published so far as it relates to the Constitution. With regard to the Code the Committee recommended the following:

1. We would omit all sections of the Code that describe the obligations of patients to their physicians, and of the public to physicians. The reason for this suggestion is that the Code is not designated either for patients or the public, and so the sections are superfluous. This omits the ten sections under Art. 11, on pages 5, 6, 7, and 8, and Art. 11, on page 20.

2. We suggest the placing in the same list with the copy-righting of medical books and other similar work, the patenting of all mechanical appliances used in medicine or surgery. The Code says nothing respecting the copyrighting of medical publications, and we find no good reason why it should say anything respecting the patenting of mechanical devices.

3. We recommend the more accurate definition of the term "consultation," as we find good reason to believe that serious

estrangement has arisen between physicians because of the different ideas they attached to this term. The Code of Ethics, page 14, second line from the top, says that in a "consultation" the responsibility must be equally divided between the medical attendants—they must equally share the credit as well as the blame of failure. With this statement before us, it is clear that there can be no consultation when one physician meets another for the purpose of obtaining from him an account of the case, or pertinent facts of family history, or a record of the past management of the case, in order that he may more intelligently assume the entire responsibility of its future conduct. Thus the Existing Code of Ethics of the American Medical Association defines a consultation substantially as a meeting of doctors to discuss a case to the end that they may equally share in its further management. By the same authority a consultation is not a meeting of physicians with a case, in which one gets all the facts possible from the other or others, as a preliminary to his assuming entire responsibility in its future conduct.

From these data it is clear that usually the specialist does not consult with the general practitioner. He simply obtains all the facts the general practitioner possesses, preparatory to assuming full control of the case.

There are many other occasions for the meeting of medical men in connection with cases of sickness, that are in no sense consultations according to the existing code. Hence we think that in the interest of scientific accuracy, there should be a discrimination made in the study of consultations, as present conditions differ widely from those of forty or more years ago.

Having promised this much, your committee recommends the alteration of article IV, section 1, page eleven, Code of Ethics, to read as follows: "A thorough medical education furnishes the only presumptive evidence of professional abilities and requirements, and ought to be the only acknowledged right of an individual to the exercise and honors of his profession. Nevertheless as the good of the patient is the sole object in view, and this is often dependent upon personal confidence, no intelligent practitioner who has a license to practice from some medical board of known and acknowledged legal authority to issue such license, and who is in good moral and professional standing in the place in which he resides, should be refused consultation when it is requested by the patient."

4. It is suggested that it would be wise to re-write the code in phraseology so plain as to make it a practical, common sense document for daily guidance in the performance of our various duties and an aid in meeting responsibilities incident to our professional life.

Finally, your committee found that in but few medical colleges has this document been taught, and never as a portion of the required curriculum.

It is believed that professional success of the best sort depends as well upon a practical knowledge of medical manners and medical ethics as upon anatomy, pathology, therapeutics or surgery. To be master of the rules of conduct by which our neighboring doctors can be made our friends and kept such, so that the people may see that the medical men who serve them form a band of brothers devoted to the service of suffering humanity, is to possess a most desirable professional resource.

The committee finds the Code of Ethics contains the essentials for the successful conduct of a medical career, as these have been learned by the actual experience of the best members of the medical profession, from the earliest dawn of history to the day on which it was written.

It sincerely trusts that the present discussion will lead to a more intelligent appreciation of its truths by all physicians, and especially that hereafter it will be made a text-book in every medical college, and an accurate knowledge of its contents be made a condition of receiving the degree of Doctor of Medicine.

The Committee depreciates all efforts to abolish, belittle, distort, ridicule, or otherwise to lessen its hold upon the profession. It is a heritage, representing at once the best characteristics of our profession during all its history, and a scientific document that points out the line of greatest prosperity in the future.

It would seem far better that in the spirit of scientific students we patiently inquire whether in any respect the changes incident to the last half century warrant any modifications of statement of

any portion of this document, in the interest of good to all and ill to none, for the increased prosperity of medical art and science and a more united professional power over those whom we serve.

Dr. Henry Didama, of Syracuse, N. Y., then presented a minority report, in which he recommended leaving the present methods of representation, nomination, Constitution, and the Code as they now stand.

On motion, the majority report was adopted, the Committee continued, and the amendment, suggested, according to the Constitution, were laid over for one year.

Dr. J. B. Roberts, of Philadelphia, entered his protest against the construction of the Constitution by the Chair, requiring the action on the Code revision to be postponed until the next annual meeting.

Dr. N. S. Davis, of Chicago, called attention to the law which declares that all amendments must lie over for one year.

The President decided this in order, and said the amendment *must* lie over.

Dr. N. S. Davis then made a report on behalf of the Committee to confer with committees from the Medical Society of the State of New York, and the Medical Association of the State of New York. The Committee said in its report that when it is remembered that the so-called technical differences existing between the two Associations referred to and the American Medical Association, consist of nothing less than a deliberate abolition of the National Code of Ethics, which is equivalent to a voluntary withdrawal of said Associations from further connection with the National organization, it must be apparent to all that it would be most unwise for this body to make any propositions relating to the medical society of the State of New York.

On motion, the report was received and filed.

There being no further business, the Association adjourned till Thursday, 11 A. M.

THURSDAY, JUNE 8th, THIRD DAY, GENERAL SESSION.

The Association was called to order by the President at 11 A. M.

After the announcement of a concert to be given at Schiltz Park, under the auspices of the local physicians of Milwaukee, by the Chairman of the Committee of Arrangements, Dr. Wingate, President McGuire introduced Mr. Earnest Hart, of London, who delivered an address entitled

CHOLERA AN EXCLUSIVELY WATER BORNE DISEASE.

He said in dealing with the subject of cholera, it was one which had perhaps been more written about, more discussed, than any other of our time. It was the subject of universal conversation. Cholera was no longer a thing to be dreaded, to be wondered at, or to be beyond control. In old text-books cholera was summarized briefly as follows: Diagnosis of the disease easy; pathology uncertain; causation unknown; treatment useless. All this had been modified. Cholera was a filth disease, carried by dirty people to dirty places and spread by dirty or impure water. He denied that the advent of cholera was mysterious, or that any of the incidents of its diffusion were unknown. He looked upon quarantine as a tribute that dirt pays to cleanliness. Cholera comes from India and India only, although it sometimes hibernates in Europe. It had two routes, one across the Caucasus to the Baltic ports, and thence, either directly or through Hamburg, westward. The other route was from Mecca by pilgrim caravans or boat via Alexandria to Europe. Last year's epidemic originated in Cashmere and was brought to Hamburg within five months. All mysterious talk of transmission of the disease by atmospheric currents belonged to a past period, We used to talk of thunder being mysterious, and it is just as reasonable to talk of cholera being mysterious. It was still a common popular notion that cholera comes by Providence and goes by drugs. This was the precise opposite of the truth. Cholera was a man created disease and drugs were, comparatively speaking, powerless against it. The war against cholera was the war of cleanliness against filth, and the one kind of cleanliness which was absolutely essential and in the face of which cholera could not spread or become epidemic, was purity of our drinking water. No community could have the disease that did not invite it by the habitual contamination of its water supply. Fumigation, railroad quarantines, libations and sprinklings with antiseptic pow-

ders and fluids were vain ceremonies, mere sacrifices to the popular ignorance and prejudice. They created a false security and detracted attention from the only important agent of safety, namely, purification of soil, air, and water, but, above all things, purity of water. When the people insisted upon municipalities and corporations giving them pure water, cholera, which the speaker considers a man-created disease, will become extinct and its terrors a mere recollection. The latest results of microscopical examination and bacteriological research confirmed the vast mass of evidence collected in the statistical document the speaker had before him, and clinically it has been shown that there never has been an outbreak of cholera in Europe that could not be traced to the distribution of an infected water supply. This was a matter of clinical and statistical observation. He believed that the members of the Association would see to it, as far as possible, that the people got pure drinking water. If the Association as a body put itself on record in such an important matter, its voice would be potent and he doubts not successful.

At the close of the address, Dr. Wingate offered a resolution of thanks to Mr. Hart for his able address, which was unanimously adopted; and that the address be published in medical journals *in full* and copies sent to all State Boards of Health, etc.

Dr. Henry H. Mudd, of St. Louis, then delivered the Annual Address on Surgery. He selected for his subject

SURGICAL PROBLEMS.

He said surgical cleanliness had taught us that drainage is not essential to the rapid healing of grave or extensive wounds. This advance had clearly defined a marked difference in the object to be obtained by primary and secondary drainage. No intelligent surgeon was ready to discard the use of secondary drainage in suppurating wounds, but there were many who asserted that they do not use it in fresh, clean wounds, no matter how extensive they may be. The interest in the coutroversy had been narrowed down to the use or abuse of drainage in operative wounds which were clean and aseptic. It must be awarded a new place now, when perfect cleanliness is supposed to accompany every fresh wound. Can we dispense with the drainage tube in all so-called clean wounds? He thought not. Antiseptic surgeons assert that every operative wound can be aseptic, and by a proper technique union by first intention can be secured. The conditions to be fulfilled to attain this end with a patient in fair general condition were an incised wound, a thorough hemostasis, a perfect approximation, and the immobilization of wounded surfaces.

Another problem was the possibility of securing the permanent surgical relief of hernia. A permanent cure was established in many cases in children by the restraining influence of a truss. In individual cases where this permanent retention of the herniated viscus is possible during childhood it should be given a full trial before resorting to operative measures, since they are still uncertain in their results. The cure of hernia in adults by truss wearing was an improbable event, and should not influence the decision against operative relief. Permanent recovery follows operative effort, he believes, in from 60 to 80 per cent. of the cases. Even the lower per cent. justifies continued operative effort.

The treatment of appendicitis was still an open question. The care of the individual case offered choice of lines of treatment which made most difficult a decision. The anatomical and clinical investigations of the past few years had demonstrated very clearly that the American idea of the pathology of inflammations in this region was correct.

The next thing in order was the report of the Nominating Committee, which was read by the Chairman, Dr. Truax, of New York. The committee recommended for

President—James F. Hibberd, of Richmond, Ind.

First Vice-President—John A. Wyeth, of New York.

Second Vice-President—I. N. Love, of St. Louis, Mo.

Fourth Vice-President—U. O. B. Wingate, of Milwaukee, Wis.

Treasurer—Richard J. Dunglison, of Philadelphia, Pa.

Secretary—William B. Atkinson, of Philadelphia, Pa.

Assistant Secretary—H. B. Ellis, San Francisco, Cal.

Librarian—Geo. W. Webster, of Chicago.

Editor Association Journal—J. C. Culberston, Chicago.

Trustees—J. B. Hamilton, Chicago; E. E. Montgomery, Philadelphia; E. Fletcher Ingals, Chicago; L. S. McMurtry, of Louisville.

Members of Judicial Council—X. C. Scott, Ohio; G. W. Stone, U. S. Marine Hospital Service; J. T. Jelks, Hot Springs, Ark.; J. H. Murphy, of Minnesota; J. McFadden Gaston, Atlanta, Ga.; T. A. Foster, Maine; I. N. Quimby, New Jersey.

Address on Medicine—C. H. Hughes, St. Louis.

Address on Surgery—Ernest La Place, Philadelphia.

Address on State Medicine—Geo. H. Rohe, Catonsville, Md.

Place of meeting—San Francisco, Cal.

Chairman of Committee on Arrangements—R. H. Plummer.

The nominating committee also recommended that the Secretary be paid an annual salary of $500.

It was moved that the report be adopted. Seconded.

Dr. Rohe moved to substitute Baltimore as the next place of meeting, but after ringing and enthusiastic speeches made by a member from California, Dudley S. Reynolds, of Louisville; Leartus Connor, of Detroit; H. A. Hare, of Philadelphia; Marcy, of Boston; N. S. Davis, of Chicago, and F. W. McRae, of Atlanta, Ga., the report was adopted as read.

The report of the Committee of President's Address was then read by Dr. Hibbera, endorsing in the form of resolutions, all the suggestions contained therein.

On motion the report was adopted.

On motion of Secretary Atkinson, several Canadian physicians were made members by invitation.

Dr. John B. Roberts, of Philadelphia, offered a resolution to the effect that all amendments now on the calender be postponed until the meeting next year, to be taken up on the second day of the Association meeting in general session.

Carried.

There being no further business, the Association, on motion, adjourned till Friday, 11 A. M.

FOURTH DAY, FRIDAY, JUNE 9TH, GENERAL SESSION.

The Association was called to order by President McGuire, at 11 A. M.

Dr. Walter Wyman, of Washington, D. C., read the Address on State Medicine. He selected for his subject "Extinction of Contagious Diseases." He said the history of the world shows that whole races of men and animals have become extinct. Why should not races of microbes become extinct, and certain diseases that once ravished the earth in epidemic form have so lost their inherent strength or have been so controlled in the latter part of the nineteenth century as to warrant the belief that their histories are closed, or fast closing.

With regard to yellow fever, the great period of its history was from 1793 to 1805. Formerly it was of common occurrence in Europe, the ports of Spain, in particular, suffering severally between 1801 and 1825, but there has been no disaster epidemic of this disease in Europe since that of Lisbon in 1857, thirty-six years ago. Its earlier history in this country includes invasion not only of the South, but of ports as far north as Pennsylvania, New Jersey, New York, and even New Hampshire. But to-day, though constant vigilance against its introduction is necessary, it has practically vanished from the ports of the United States.

He said since the discovery of vaccination by Jenner in 1796, small-pox, though still a stubborn foe, no longer devastated without restraint. It was now simply a matter of choice whether one shall be made absolutely proof against this disease, and the good effects of a compulsory law regarding vaccination were seen in the statistics of Prussia, in which country for six years prior to the enforcement of vaccination the deaths from small-pox averaged 85 per 100,000 of the inhabitants, while from 1875 to 1886, after the law came into force, the yearly average was but two per 100,000.

Typhus fever flourished to-day in certain parts of Mexico, and was occasionally reported from the Old World. It was always a menace where large numbers of people were crowded together with unsanitary surroundings. But it has no permanent lodgment in the United States, and the energetic and successful measures instituted by the Board of Health of New York during the past winter to suppress this disease, although it appeared in a section of the city more densely populated

than that of any other city in the world, were a striking example of what may be accomplished by proper law, energetic execution and scientific disinfection.

With regard to cholera, which was still an ever threatened menace, the history of the past few years had demonstrated most clearly its relation to filth and to contaminated food and water, both of which conditions required only the peculiar energy and love of cleanliness characteristic of the Anglo-Saxon race. In recent years the superior sanitation of England, and the more perfect quarantine surveillance of the United States, had served to protect these two nations from this exotic disease. One possible agency in the elimination of these diseases, still young as a science but not without promise, was protective inoculation. Whatever opinion may be held of Freire's inoculations for yellow fever, and Kitisato's and Haffkine's inoculations for cholera, the investigations of these and other bacteriologists in this particular field, warranted the hope that results would be attained equal in efficiency to vaccination for variola.

The Permanent Secretary read an invitation from the American Pharmaceutical Association, to send delegates to their meeting at Chicago, August 14, 1893.

The Permanent Secretary presented, from the General Business Committee, the following resolutions, which were adopted by the said Committee, and were submitted for the approval of the Association:

Resolved. That no paper shall be read by title in any section which is not actually in the hands of the officers of the Section, and that the Secretary of the Association be instructed to communicate this action to each Section.

Resolved. That the General Business Committee hereby request the officers of Sections to communicate to this Business Committee any general resolutions passed relating to the conduct of the Sections.

Resolved. That we recommend that the Treasurer and Committee of Arrangements adopt measures to secure, by courteous circular letters, as large a registration of members as possible by mail, three or four weeks before each annual meeting. Also, that one month after the annual meeting each member who has not paid his annual dues, be sent a notice that dues have not been paid, and that he be requested to remit the same; further, that similar notice be sent at each of the two succeeding months to those who do not remit; and that those who still fail to remit be drawn on at sight at the beginning of the next month, having been notified that they would be thus drawn on at the time specified.

Unanimously adopted.

From the Section of Materi Medica and Pharmacy, a resolution was offered and adopted to the effect that the American Medical Association recommend that the next edition of the United States Pharmacopœia soon to be issued be at once practically adopted by physicians in prescribing and pharmacists in compounding. It also advises the general adoption by physicians and pharmacists of the National Formulary issued by the American Pharmaceutical Association, and that the teaching medical and pharmaceutical colleges adopt these works as text-books.

Dr. J. E. Boylan offered the following amendment to By-Law number 11 relating to Sections. The first clause of paragraph 5 shall be amended to read:

"It shall be the duty of every member of the Association who proposes to present a paper or report to any one of the Section, to forward either the paper or a title indicative of its contents, and its length to the Secretary of said paper, at least one month before the annual meeting at which the paper or report is to be read." Adopted.

A communication from Dr. J. M. Toner, of the Committee on Jenner Centenial, reported progress, and asked permission to fill a vacancy in the Committee owing to the death of Dr. T. F. Wood, of North Carolina.

The report was received and permission granted.

The President announced delegates to the Eleventh International Medical Congress at Rome, and also a delegate to the American Pharmaceutical Association in the person of Dr. Frank Woodbury, of Philadelphia.

On motion the President and Permanent Secretary were granted authority to appoint other delegates, if deemed desirable.

The Permanent Secretary read the following as officers of Sections.

Surgery and Anatomy—Chairman, J. B. Roberts, Philadelphia; Secretary, F. W. McRae, Atlanta, Georgia.

Practice of Medicine — Chairman, H. A. Hare, Philadelphia; Secretary, W. H. Washburn, Milwaukee.

Obstetrics and Diseases of Women—Chairman, Joseph Eastman, Indianapolis; Secretary, George I. McKelway, Philadelpaia.

Neurology and Medical Jurisprudence.—Chairman, J. G. Keirnan, Chicago; Secretary, Frank P. Norbury, Jacksonville, Ill.

Ophthalmology—Chairman, A. R. Baker, Cleveland, O.; Secretary, L. H. Taylor, Wilkes Barre, Pa.

Laryngology and Otology—Chairman, E. Fletcher Ingals, Chicago; Secretary, J. F. Fulton, St. Paul.

Materia Medica and Pharmacy—Chairman, Frank Woodbury, Philadelphia; Secretary, F. E. Stewart, Watkins, N. Y.

Diseases of Children—Chairman, W. S. Christopher, Chicago; Secretary, Frank A. Churchill, Chicago.

State Medicine—Chairman, George W. Stoner, U. S. Marine Hospital Service; Secretary, C. H. Sheppard, Brooklyn.

Dermatology and Syphilography—Chairman, A. H. Ho Ohmann-Dumesnil, St. Louis; Secretary, L. F. Frank, Milwaukee.

Physiology and Diatetics—Chairman, I. N. Love, St. Louis; Secretary, E. Cutter, New York.

Oral and Dental Surgery—Chairman, W. H. Fletcher, Cincinnati; Secretary, E. S. Talbot, Chicago.

The President appointed as the Committee to confer with the American Public Health Association Drs. U. O. B. Wingate, of Milwaukee; Jerome Cochran, of Alabama, and J. H. Parkinson, of California.

Dr. Robert Reyburn, of Washington, D. C., offered resolutions of thanks, which were unanimously adopted.

Dr. James T. Jelks resigned from the Judicial Council because he was already a member of the General Business Committee.

On motion the resignation was accepted.

President McGuire, in retiring, thanked the Association for the kind treatment extended him and to the Permanent Secretary and others who had aided him so efficiently. He then introduced Dr. J. F. Hibberd, of Richmond, Ind., the President-elect, who assumed the chair in a felicitous manner, asking all to go to California next year and in every way to aid in building up the Association.

There being no further business, the Association adjourned to meet in San Francisco, Cal., on the first Tuesday in May, 1894.

Swallowing a Watch.

The freaks of lunatics are sometimes extraordinary, and one of the most remark able which has been placed on record recently is that which Dr. Vallow has published in the current issue of a French contemporary. A man, aged 37, was confined in an asylum suffering from hallucinations, and one day, his wife having come to visit him, he was permitted to see her. When the alloted time of the interview, according to the rules of the institution, had come to an end, his wife intimated that she would have to take her departure, whereupon the patient, judging that she wanted to leave him before the time had expired, flew into a violent passion and accused her of deceiving him. To prove, however, the truth of her statements, she drew out her watch and showed him the time, but as soon as the patient saw the watch, he suddenly seized it in his hand, tore the chain from it, and, putting it in his mouth, swallowed it. The medical officer of the asylum was summoned at once, but the patient in no way appeared to have suffered from his curious freak. On examination of the stomach nothing could be felt, and it was at first believed that after all the watch might not have been swallowed. However, all due precautions were taken, and on the sixteenth day the watch arrived per naturalem viam. It was a silver watch measuring about two inches and a half in diameter, exclusive of the ring, and about half an inch in thickness.—*Medical Review.*

"I want some ribbon," she said, "to trim a baby basket, and I am undecided about the color." "Baby basket!" said the clerk briskly. "Oh, yeller, by all means." "Yes," she said, "but this is for a baby dog." "All right," he said, "then purp'll do nicely."

It is hard to find a preacher who does not think he can do most for the Lord where the pay is highest.—*Ram's Horn.*

THE MEDICAL AND SURGICAL REPORTER

ISSUED EVERY SATURDAY

ADDRESS
Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D.,
Editor.

RODERIC C. PENFIELD,
Publisher.

316 - 18 - 20 North Broad Street,
PHILADELPHIA.

TERMS:—Five Dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

REMITTANCES should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

NOTICE TO CONTRIBUTORS:—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, JUNE 24TH, 1893.

EDITORIAL.

DRAINAGE NEEDED.

The *Virginia Medical Monthly* for June, contains a paper recently read before the New York Obstetrical Society, in which the aspiring writer displays more skill as a scribe than he does as a surgeon. The paper is a fair sample of the genius of the *library* surgeon, but from the standpoint of *practical* surgery the whole production is marked with crudity and inexperience, superficial observation and illogical conclusion. On the strength of a few abdominal sections performed, the author delivers himself of a screed on drainage. In the paper there are some truths that have long since become platitudes among modern surgeons, and there are some statements which, we venture to say, no one but the author himself has ever found to be true. We note some of these statements and follow with a few comments:

1. "Those who drain still cling to washing out the abdomen, to chemical antisepsis and the drainage tube."

2. "If you irrigate, you must use the tube to remove the fluid you thus introduce."

3. "If warm sterile water be introduced and is followed by the injection of pathogenic germs infection takes place."

4. "If the drainage tubes are introduced, it has been proved impossible to avoid post-operative infection without the use of antiseptics. So a clean operation is rendered foul by them."

5. "The only sepsis the drainage tube removes is that which is introduced by the operator and the only irritating fluid drained away by it is what he has put in."

6. "The results of the drainage are: Possible infection of the wound; probable ventral hernia; inevitable binding together of the intestines by adhesions."

7. "It is utterly impossible to remove these growths and close the belly, unless we see what we are doing, do a perfectly aseptic operation without the use of strong

chemicals, and catch by means of gauze, any septic contents of sacs evacuated."

8. "Some cases *must be drained* but not by a small glass tube."

9. "The convalescence of drainage tube cases is usually febrile, showing that infection has occurred."

1. "Those who drain do not now nor did they ever cling to antisepsis. The two leaders in abdominal work, who stand for drainage in England and America, Lawson Tait and Joseph Price, have always preached the doctrine of surgical cleanliness only. No men have less use in surgery for chemicals of any kind than do Tait and Price.

It may be that the author of the paper in question has confined his observation to New York alone and has never got far away from home. If, in New York, those who drain use chemicals, he might spend a few weeks in Philadelphia to great advantage. While making his observations he will also find that those who drain do not always irrigate.

2. Those who irrigate do not necessarily use a tube to remove fluid thus introduced. Nothing is more common than to see Joseph Price leave the belly full of clean water and close the wound without drainage, and other operators do likewise.

3. This third statement, if true, has no bearing or weight because no one but a bungling operator will put infection into the belly either before or after an operation. This may be a discovery valuable to the author in his work, but it will influence others very little indeed. Especially one to whom an aseptic technique has become a habit.

4. The fourth quotation is not true for Philadelphia and, if the author has found it true in New York, he has certainly passed very little time among the best operators, and is giving his own experience. How one who can do a clean operation will befoul it by putting in a tube, unless he puts in a dirty one, is a conclusion that all must reach who reflect for a moment.

5. A clean operator does not put in sepsis nor does he put in irritating fluid. Clean hands, clean instruments and clean water are the means used by all successful operators; and those who drain have the largest experience and the lowest mortality as yet on record. Again we must say to the author of this paper, if those who drain in New York are doing such dirty work come over to our city and see something clean—it will give you new ideas in drainage.

6. The results of drainage are, in our experience and observation, absence of infection, more ease and comfort, greater security against hemorrhage, absolute lack of influence in the causation of hernia and a positive lessening of the probability of adhesions.

7. To one of little experience and a poorly educated hand, it may be necessary to see. But the best operators gain nothing by standing the patient on her head. Why chemicals are more needed after or during an operation in the ordinary dorsal decubitus than when done in the Trendelenburgh position it would puzzle any operator to determine.

8. After stating that the cases he reports include almost every variety, and that they show the utter uselessness of drainage, he contradicts all that he has before said by admitting that some cases *must be drained*. Well, this is all that any advocate for drainage claims. That *some cases must be drained*—the judgment of the surgeon alone determining which ones.

9. In the experience of those in Philadelphia who practice drainage they usually have less trouble than simple cases that are not drained. The convalescence of drainage tube cases is hardly ever febrile. A series of difficult cases with drainage suffer less and have less fever than a series of much simpler cases without the tube.

There is something wrong in the work or the observation of a man who formulates such statements as that numbered 9 above.

As to his statements on vaginal incision and drainage for pyosalpinx and ovarian abscesses, they are correct enough if they are applied. No man in Philadelphia at least, who advocates abdominal drainage, ever thinks of incising and draining *per vaginam*. That idea is peculiarly a New York product, and was elaborately set forth last year by a prominent New York operator, who was unable to defend it against the onslaught of his critics.

ABSTRACTS.

OUR DISPENSARIES, HOSPITALS, PHILANTHROPY, FRAUDS, AND THE NECESSITY OF MEDICAL REFORM.

Dr. Criado, in an address delivered before the Kings County Medical Association, in speaking on "Our Dispensaries, Hospitals, Philanthropy, Frauds, and the necessity of Medical Reform," presents the problem which most obviously and inevitably suggests itself to us at an earlier or later period, which we conceive but carelessly and wilfully neglect from committing to our united judgment, and for which reason our most indispensable services are generally welcomed with diffidence, our knowledge judged frivolous, and the profession generally as mostly composed of half-witted, antiquated, ceremonious extortionists, notwithstanding that *in articulo mortis* we are deemed *the most desirable* and *trusted friend*. The doctor respectfully suggests that the medical profession should awaken from the perpetual sluggishness and apperent lassitude or indifference which have heretofore characterized it, with the object of *enacting, promulgating*, and if necessary, of *having legislated* the reform by which we might overcome in the most judicious and honest manner the difficulties that confront us, not alone in our own behalf, but in that of our deserving families and of the inconsiderate public. With this object in view, and in the hope that he might energetically stimulate the interest and *good judgment* of every thoughtful member of the medical profession, offers the following suggestion, to wit:

With reference to our dispensaries:

1st. That no physician should be deemed qualified to serve in any dispensary unless he or she shall have pased a fair and honest competitive examination, and that said appointments should receive due consideration in their respective order of merit.

2nd. That physicians thus qualified and appointed to serve, should be justly remunerated by the *so-judged charitable* and *magnanimous* dispensary trustees, from an adequate city appropriation thus directed by special Act of Legislature, or otherwise.

3d. That the period of said appointment should not exceed three years.

4th. That at the entrance hall and in every dispensary room occupied by physicians, a large placard should be displayed in a conspicuous place, making it known that the institution is intended for the care of the destitute and poor *only*, and that all persons applying thereto for gratuitous medical advice possessing or being able to realize the sum of $250, or more, will be deemed guilty of fraud and misrepresentation, and prosecuted accordingly.

5th. That amongst other things, it should be the duty of all dispensary physicians to ascertain by direct questions the circumstances of every individual applying to them; to enter the replies to such inquiries in whatever ledger be appropriate, together with the name, address, nationality, diagnosis, treatment, etc., etc., of said applicants, and to assist in the prosecution of all deemed guilty of fraud and misrepresentation.

6th. That any physician convicted of soliciting dispensary patients for his

private practice should be dishonorably discharged, and henceforth disqualified from serving *in any despensary or hospital.*

With reference to our hospitals:

1st. That no physician should be deemed qualified to serve in any hospital unless he or she shall have passed a fair and honest competitive examination: that said appointments should receive due consideration in their respective order of merit, and that it be required that all candidates shall have graduated at least three years previously.

2d. That physicians thus qualified and appointed to serve in hospitals for *non-contagious diseases* should serve without compensation, and that the period of appointment should not exceed three years.

3d. That the physicians thus qualified and appointed to serve in hospitals for *contagious diseases* should be justly remunerated for their services, and that the period of appointment should not exceed eighteen months.

4th. That the appointment of house surgeons or physicians in hospitals for *non-contagious diseases* should be continued under the present system, in consideration of board and lodging.

5th. That physicians appointed to serve as house surgeons or physicians in hospitals for *contagious diseases* should be justly remunerated for their services.

The advantage offered by the aforesaid suggestions might concisely be summarized as follows, to wit:

1st. That *old*, *young* and *recent medical graduates* would be equally privileged to enter into an honest, competitive examination for appointment in any dispensary, and thus be enabled to have the opportunity to earn the just remuneration, and oftentimes required contributive, pecuniary assistance for the period of three years.

2d. That by eliminating the well-to-do imposters from our charitable dispensaries, not only would we be enriched by at least forty per cent. of the amount that we are continuously defrauded of, but moreover said dispensary physicians would be *enabled* to devote *the proper attention* and *time* due to the deserving poor with the least possible speculative temptation of soliciting dispensary patients for their private practice.

3d. That the requirement of a competitive examination for appointment in any dispensary, or hospital would readily overcome the friendly tendency of *favorism* or *cliques*, and more so, of *monopolization*, inasmuch as it is not only detrimental in general to the profession, but likewise to the community at large, that physicians and surgeons, who have *thus* been appointed five, ten, twenty or thirty years ago, should withal persist in retaining said appointments *forever and amen*, until the day of judgment. There is no acceptable reason or excuse whatsoever for our present forbearance of such a monopoly, inasmuch as in *every instance* practical experience and continuous observation would certainly tend to improve the knowledge of the *otherwise most ignorant* who become thus *undeservingly* associated with a certain dispensary or hospital, or with as many more as possible, attaining reputation and *popularity through the advertising medium of the freely distributed annual reports of said institutions.*

4th. That the practical knowledge attained at a hospital in the capacity of physician and surgeon during the appointed period of three years, should be deemed an adequate compensation for services rendered in hospitals for *non-contagious* diseases.

5th. That physicians and surgeons desirous of prolonging their term of dispensary or hospital service, for reasons which might be best known to themselves, would be necessarily obliged to undergo *another competitive examination,* and thus deservingly and honorably secure the appointment which was openly tendered to the most worthy and successful competitive candidate.

6th. That with the very incomplete enumeration of the facts and suggestions herein *submitted to our united consideration and judgment*, we might possibly become less *promiscuous* in our philantrophy; more *conscientious* in all our charitable undertakings; *wiser* inour own behalf and for the well-being of our families; more *friendly* and *honest* towards one another in our professional intercourse and good will; and *henceforth*, *deserving* of the *full confidence* of the community, by not permitting ourselves to be led astray by the few monopolists who have profited at the expense of our apparent simplicity.—*The Brooklyn Med. Jour.*

THE SURGERY OF CHILDHOOD.

F. H. GIBBY, M. D., Nashua, N. H.

It is as true in surgery as in medicine, that the practitioner who does not seek to understand and appreciate the distinguishing preculiarities of diseases and accidents, as they affect children, narrows very much the field of his usefulness; and however thorough his general knowledge, or however great his practical excellence as a surgeon, has much yet to learn.

If writers on the medical diseases of childhood justly insist, as preliminary to all other considerations, upon the necessity of care, gentleness, and tact, in the examination of infantile diseases, and the proportionately greater attention which is to be paid to the purely objective symptoms of disease in these young subjects, these considerations are, *a fortiori*, indispensable in the surgical maladies of early life. For, except in the case of unconscious infancy, how important it is that the visit and examination of the surgeon should be conducted with such kindness, and delicacy, as to disarm the fears of the patients; and, if unnecessarily alarmed and excited, how completely may their cries and struggles defeat the object of the visit or examination. Let us begin with a real sympathy with our patients, which cannot be hard to do, for who does not pity and feel for the sufferings of children? It seems to me, too, that we have a duty also in the education of parents; we ought earnestly to rebuke the the wretched folly that some parents are guilty of, in making the doctor a terror and a bugbear to their children; telling them if they are naughty the doctor will cut their ears off, and such like abominable practices.

With regard to the importance of objective symptoms, how idle and useless are many of the questions usually addressed to young children; as for instance, moving a diseased or injured limb, or making pressure to discover the existence of tenderness, and asking "does that hurt you?" The patient, either puzzled or terrified at the process, will often answer yes, whether it hurts him or not; but watch the face; it don't lie; children's faces never do; its answer is alone reliable, and to be depended on. Above all things, in examining a case of surgical disease or injury in a child, particularly one over a year old, time and patience are absolutely necessary; he who is in a hurry, or who has not almost unbounded patience with the unreasonable fears and fancies of little children, will be constantly liable to mistake, and must suffer many anxieties and fears, which a little more long-suffering would have prevented.

As germane to this subject, allow me to insist upon the very great importance of good *nursing*, in the surgical diseases and operations of childhood. Nothing whatever can take the place of the unremitting attention of a mother, or other affectionate nurse, who is used to children, for the first few days after any injury or operation. This should be a foremost consideration with the surgeon, and no pains should be spared to obtain it. For want of it, all his skill and efforts may be completely neutralized, and rendered of no avail. Especially is this of importance in those operations, not uncommon in early life, where everything depends upon obtaining union by first intention, as it is ordinarily called.

Among the surgical diseases peculiar to childhood are all the malformations, such as hare-lip, imperforate anus, nævus, supernumerary fingers, club-foot, spina bifida, etc., together with croup, rickets, congenital syphilis, a certain form of enuresis, cancrum oris, noma, some forms of hernia and hydrocele, certain tumors, and some peculiar accidents, such as separation of the epiphyses, etc. There is, moreover, a large class of cases which practically belong here, although it is not true that they occur only in childhood, but they are more frequently met with at that period of life, such as enlarged tonsils, prolapse of the rectum, morbus coxarius, certain forms of inflammation of the eye and ear, foreign bodies in the air passages, ear, nose, etc.

It is particularly worthy of notice here, that what are called the diathetic tendencies, such as the scrofulous, tuberculous, syphilitic, rachitic, and so on, are peculiarly active in early life, and modify many of the diseases that are not directly

attributable to them, and some of them cease to exert their influence after the period of puberty. In addition to this many diseases common to all periods of life, such as cancer, diabetes, etc., exhibit a different form and run a more rapid course in early life. This difference in form is mainly due to the greater activity and rapidity of the processes of nutrition and interstitial change in children; and while its influence may only be to aggravate and hasten the course of malignant disease, in many other cases it renders recoveries and operations possible in children that could not otherwise take place. In the pathology of childhood the great fact is never to be lost sight of that nutrition is in excess, and whereas the adult has only to repair the waste that is perpetually going on, to hold his own, as we may say, the child has to do this too, and grow beside; to build the new as well as repair the old.

Children's vitality, of course, will not sustain an equal shock with that of more advanced life; their nervous system is much more active and susceptible, and may be utterly prostrated by a blow that the tougher and less impressionable adult would easily recover from. But unless suddenly lowered beyond the rallying point, there is really scarcely any limit to the repair that may be expected to take place, there is so much life in them. From these considerations it would seem to follow theoretically, and I fully believe it to be practically, true, that they are the best possible subjects for surgical operations. At any rate they certainly escape many of the sources of danger to which adults are exposed; their constitutions are not broken down by previous excesses or disease, or insidiously undermined by time. Whether it be owing to this, and the purity of their blood and vital fluids or not, statistics show plainly that children escape in larger proportions than adults from both the primary and secondary accidents of operations.

One very important circumstance in favor of young children, when the subjects of operation, is their freedom from mental shock. They are spared those tortures of anticipation which in adults are often so depressing, and have even been known to lead to fatal results, and which even the boon of anæsthesia has not wholly abolished.

There are two special dangers to children from operation which have been spoken of, one of which I regard as apocryphal, and the other as of great importance. The first of these is convulsions; this I was taught from my early reading and tuition to regard as a fruitful source of danger, but I have never seen it in a single instance, and have hence been led to believe that it is very unusual, and the fear of it, more the result of tradition, and *a priori* theorizing, than of actual observation. Perhaps this, too, is one of the terrors which chloroform has banished from modern surgery. The second danger referred to, is hemorrhage, and its consequent depression; this is really the gravest source of immediate danger in operations upon young children. We all know how poorly these little subjects bear the loss of blood, how cautiously the physician resorts to depletion, either general or local, in them. No pains ought therefore to be spared by the surgeon in avoiding undue loss of blood. If this is done, there is no doubt that they are the best possible subjects for operation. Inflammation scarcely ever surpasses the degree necessary for conservative and reparative processes; pyæmia is much less to be feared than in older patients; and, if you can get a child off the operating table alive, it always has a good chance to recover.

I have not spoken of pain in relation to operations on children, simply because it does not really enter into the question at all. It ought always, I think, to be prevented. Great as are the triumphs of anæsthetics in other departments of surgery, nowhere have they been of such signal benefit as in the surgery of childhood. Of the anæsthetics in use, chloroform ought, I think, to be always preferred in children; it acts more promptly, avoids that long period of struggling which ether always gives rise to in children, who never breathe the anæsthetic in quietly at first, and only struggle during the stage of excitement which immediately precedes anæsthesia, but fight against it from the first; it is less likely to produce nausea or vomiting, and thus saves time and, moreover, I believe, in children it is perfectly safe. I have never seen the least unpleasantness in its use in them; to be sure I have heard of fatal cases, but in all of them I have reason to believe that proper precau-

tions were not taken; for when I say that I regard it as perfectly safe, of course, I mean when administered carefully.

There is one point worthy of mention with regard to the administration of chloroform in children, and that is, that owing to their crying and struggles, they are very apt, after holding their breath for a second or two, to take a very long, deep, inspiration, and thus the anæsthetic is inhaled in very unequal, and often in very large doses. On this account I object to cones, inhalers and all similar contrivances for children, and think care should be taken that the cloth, or handkerchief, should not be too thoroughly saturated. In case of asphyxia or other accident, during the administration of chloroform to children, the remedies indicated, are the same as for adults; but in addition, I regard immediate mouth to mouth insufflation, notwithstanding all that has been urged against it, as a very valuable expedient.

With regard to the age at which chloroform may be given to children there is no limit whatever; it may be safely used at the earliest period of life .Not only may it be given at any age but also for any operation, with the simple exception of removing the tonsils. So, that, as far as my experience and judgment go, I would say that chloroform is indispensable in the surgery of childhood, and all but of universal applicability. Of local anæsthesia I have nothing to say. I have never tried it in children and presume I never shall. It is likely to frighten them. The application of cold, either by freezing mixtures or ether spray, causes some pain; and chloroform being so safe and certain, there is no inducement to make use of an inferior method.

But chloroform in its application to the surgery of childhood, is by no means limited to the performance of operations; in the reduction of dislocations, the diagnosis and adjustment of fractures, the dressing of painful sores, such as burns, and all examinations for purposes of diagnosis, which are likely to cause pain, it ought generally to be used. I have often been very much gratified, when called to cases of fracture in children, where before even looking at the accident I have administered chloroform and made my diagnosis and completed the dressings under its influence, to see the confidence and ease with which they allowed subsequent examinations and dressings, by the doctor who had never hurt them, while on the other hand, if this had been neglected, and at his first visit the surgeon had given pain, perhaps very severe pain, to the little patient, every subsequent one is almost sure to be an unpleasant struggle. Not only is the comfort of the little sufferer involved in this matter, but the good name of the surgeon as well, for in many cases it is simply out of the question, to make a correct diagnosis while the patient is fighting and resisting with all his might.

With regard to operations upon children, those who appear to be very delicate and unfavorable subjects not unfrequently bear operations exceedingly well and indeed improve immediately upon their performance; the fact being, that quite often the ill health and cachexia, which seems to forbid operation, are really the voice of nature calling loudly for it, and are caused simply by the disease it is intended to relieve. Nothing can be more unscientific and injurious than the very loose way in which pale, unhealthy, emaciated or anæmic children, are pronounced *scrofulous*. It is, too oten,- simply a word, in the ears of the laity, of mighty import, and one which, to them, explains any and every condition of disease, and is hence too often seized upon by the surgeon to satisfy their importunities, or, as a convenient cloak for his own ignorance or indolence.

There is a fact that still remains to be mentioned in this connection, one that is not generally fully appreciated, and that is, that children bear confinement to bed, whether from accident or disease, surprisingly well. Only let the little one be made comfortable and be kept properly amused, and it will thrive and grow fat under a confinement which, from the sickness of hope deferred, and the unreasonable impatience of older years, would reduce an adult almost to death.

Among the surgical accidents that offer peculiar features in childhood, none do so more strikingly than fractures. There are two species of fracture peculiar to early life, viz.: diastasis, as it is called, or separation of the epiphyses of long bones, and green stick or incomplete fracture. The subject of diastasis is a very interesting one, from the comparative

rarity of the accident, and from its difficulty of diagnosis, which is always great, sometimes almost insuperable. It is a subject, which even now, is very imperfectly understood, and offers a fair field for further study and research.

Green stick fracture, as it is aptly called, is a species of fracture to which the bones of children are specially liable, from their elasticity and deficiency of earthy material. It includes most of the cases of so-called bending of the bones, and it was, and still is, stoutly maintained by some that this bending is *always* accompanied with the rupture of some of the fibers of the bone, and that *every* such bending implied a partial fracture; but the experiments of Hamilton have demonstrated that the bones of young animals may be bent and straightened again without any perceptible fracture, and so henceforth, however rare we may be consider it, we shall be compelled to admit that a bone *may* be bent without being broken.

Without dwelling on the pathology or treatment of these injuries, I wish to call attention to two practical observations. First, in attempting to restore the contour of a bone thus bent, if much of its substance has been broken through, we are very apt, if we are not careful, and may even with all possible care, break the bone entirely through, and make the fracture a complete one. I do not know that there is any particular misfortune in this, but it is as well to be aware of its possibility, and to warn the parents of it, who may otherwise think something dreadful has been done.

The second point seems to me a very important one, and, that is, that these bent bones should be *thoroughly* straightened, even at the risk of breaking them quite through. If this be not done at first, it will hardly be done afterward, and, if ever so slight a curvature be left, it will increase as the bone grows, and be a perceptible deformity. Do not be deceived into the notion that it will pass away in time; that the child will grow out of it; there are things that nature fashions, moulds over, or removes; there are surgeon's blunders that she mercifully and kindly hides and puts out of sight, but this is not one of them. There is, however, an apparent aggravation of such a curvature arising from the deposit of provisional callus over the seat of fracture, and along its convexity, which *does* disappear, as the callus is absorbed, and, in some cases, this callus is so abundant, and so disposed, as to simulate in appearance a curve, where none really exists.

So much for green stick, or incomplete fractures,—there is another class of fractures which, though not peculiar to, are very common in childhood. I allude to fractures in the vicinity of the joints; in many of these cases diagnosis is very difficult indeed, and if swelling sets in at once, and is considerable, as it sometimes is, the diagnosis may be utterly impossible.

As the great object of treatment in all these cases must be to preserve the motions of the joint, so I believe the principal means toward this end are keeping the splints on for a very short time, and beginning passive motion very early, and, if need be, using it very perseveringly. This must be done by the surgeon; according to my experience it is most unsafe to trust it to parents or friends; if done thoroughly it will hurt more or less, and their firmness, under such circumstances, is not to be depended on. At the very best, these cases are perplexing and unsatisfactory, and very apt to result imperfectly; no doubt we can all recall cases in which a recovery was obtained without any deformity or defect of motion, but I am afraid this is not the rule.

It is singular, at least it has always seemed so to me, how little correspondence there frequently is between the deformity and the lameness. I have now in mind two cases of fracture, apparently of one of the condyles of the humerus, both occurring in early life, both I believe well treated, one of them by myself; one has recovered with scarcely noticeable deformity, but with very serious interference with motion; in the other, the elbow is most painfully deformed, all out of shape, as we say, yet the joint is almost as useful as the other.

With regard to fractures in general, we all know how quickly they unite in childhood, and what good results are generally obtained; but, although these accidents are much more simply and sensibly treated than they used to be, I fear we still harbor a tendency to make our appliances too confining and irksome in young children, and often retain them too long. The integument in these young patients

is very delicate and sensitive, and even when not actually abraided, is often rendered acutely painful, by strict, or long retained bandages, *particularly* if they are *wet.*

The fact is well known that children may sustain blows on the head, as a general rule, without much liability to fracture, and without the serious consequences from concussion or compression which are common in adults. But there is one result from such injuries which is almost peculiar to them, and that is convulsions. Twice have I had the ill luck to make light of such injuries in children, for the sake of quieting parental fears, and they have been followed by convulsions, and as this is always a dreadful thing to parents, the mistake was not a trifling one. They both recovered, to be sure, but I gained nothing by my want of care in the prognosis.—*Mass. Med. Jour.*

Salt as a Sweetener of Sugar.

Sugar and salt are sometimes held to be incompatible or antagonistic in their action on the organs of taste, but it is a common social experience that the addition of the slightest dash of salt adds flavor to sweet coffee, and sugar-cured hams have their own reputation, while meat and vegetables cooked "sour and sweet" are a favorite delicacy in Germany. Professor Zuntz, at the Physiological Society of Berlin, definitely explained the making of sugar sweeter by the addition of salt. From his experiments, he finds that if to a solution of sugar there be added a slight amount of salt-and-water, so weak that it excites no saline taste, the result is extra sweetening of the sugared water. The weakest of quinine solution is said also to produce similar results. The explanation given of the above seeming in congruity is that the ever so feeble saltness bitterness imparts an increased sensibility to the sensation of taste by the simultaneous stimuli, and hence an appreciation of additional sweetness.—*British Medical Journal.*

Lifemay be considered extinct (*Lyon Medicale*) if, when a needle is thrust into the skin of a corpse the puncture remains open, just as it will in a piece of leather. If life still remains, the little orifice is closed by contraction of the skin.

Amaurosis.

In functional amaurosis, Nagel gives

℞
Strychniae sulph..... gr. j.
Alcoholis..... ʒ.j.
Aquae..... qs. ad. xiv.

M.
Sig. A teaspoonful three times daily before meals.

—*Lancet-Clinic.*

Hiccough.

Dr. Whelpley recommends the following:

℞
Subnitrate of bismuth..... grs xlv
Oxide of zinc,
Valerianate of zinc,
Powdered calumba.....āā ʒj
Powdered opium..... grs.jss
Spirit of anise to flavor.

M. Sig.—This dose is half a teaspoonful in a wine glass of sweetened water.

—*Ex.*

Diphtheria.

A local application which meets with almost universal approval is Gaucher's mixture:

℞		GRAMMES.
	Acidi tartarici.....	1
	Acidi phenic.....	5
	Alcohol.....	10
	Ol. ricini.....	15
	Camphor.....	20

M.

This is applied to the throat every two hours, being rubbed into the membrane (as much as possible of which is first carefully stripped off) pretty thoroughly, hemorrhage being carefully avoided. Ten minutes after each application a nasal douche of one-half per cent of phenic is given, the child's head being held bent over a basin to prevent the liquid being swallowed:

Other favorite formulæ are:

℞		GRAMMES.
	Acid phenic.....	5
	Alcohol.....	10
	Camphor.....	20
	Glycerinae.....	25

M.

—(*Hutinel*).

℞		
	Acidi salicylic.....	1
	Infus. eucalypti	60
	Glycerinae.....	30
	Alcohol.....	15

M.

—*Simon in Boston M. and S. Jour.*

A Natural Supposition.

Mr. Tulkinghorn—"There is a very fine picture of our minister in to day's paper."

Mrs. Tulkinghorn—"Indeed! What has he been cured of?."

Timid Lady—"Oh, doctor, do you think cholera will get a foot hold in America?"

Doctor—"Certainly not, madam, that isn't the kind of a hold cholera gets in any country."

CURRENT LITERATURE REVIEWED.

THE VIRGINIA MEDICAL MONTHLY

for June. Dr. R. H. Garthright contributes a paper on

Puerperal Fever—Its prevention and treatment.

The author holds that if the accoucheur will exercise rigid antisepsis in the treatment of his patients, he will rarely be called upon to treat a case of puerperal septicæmia.

We should look at a woman about to be confined as we look at any case of surgery, for, when she has given birth to her infant she is often found bruised and lacerated. Put the parturient canal in an aseptic condition at the onset of labor. Prevention is easier than curing.

There is no treatment of puerperal septicæmia superior to the repeated cleansing of the parturient canal with hot bichloride of mercury injections,—keeping up, if possible, the lochial discharges, quinine in full doses during the first stages, in tonic doses later, morphine, turpentine stupes over the abdomen, digitalis as indicated, digestive remedies, stimulants, and plenty of good nourishing food.

The author reports two cases of puerperal fever which were due to neglect of strict antisepsis. In this connection he reports a case of the little daughter of one of the patients who had an open wound on her wrist, caused by a fall against a hot stove. The child was accustomed to get under the bed covers with her sick mother and remain there for an hour or two each day. The puerperal poison was absorbed through the wound and the child barely escaped with her life. The arm to the shoulder was inflamed and terribly distended. The fever was high; all of her symptoms resembling those of her mother.

Dr. W. H. Link discusses the subject of

Appendicitis,

reporting two cases operated on by Drs. J. and M. Price. In one of the cases there had been several attacks of inflammation, each one apparently cured by medicinal treatment. Dr. Link points out that this may constitute a grave source of error in the statistics of appendicitis, since each of the attendants might report the case as cured without recourse to surgical measures. The author urges operation as soon as the diagnosis is made. If the operation is postponed, then a very good time for surgery is between two attacks, or in the stage of quiescence.

Any pain coming on suddenly and felt in the right iliac region is to be suspected as an appendicitis. If there is tumefaction and hardness at or before the onset of pain and fever, it is most likely to be simple impaction, or accumulation of fæces at or near the head of the colon. If tumor is absent at first, and the fever runs higher as time passes, and tumefaction deep seated comes on gradually, the fever pains and the tenderness keeping step with it, we may almost unhesitatingly pronounce in favor of an inflammation at the head of the colon or an appendicitis. With this condition, an early resort to surgery will give the most gratifying results, and no further delay is permissible if the welfare of the patient is to be considered. Whether or not the appendix should be removed will depend upon the conditions found. If adhesions are not plentiful nor strong; if the head of the colon can be brought in sight with but little violence; if the appendix itself can be readily found—by all means let it be removed. But if opposite conditions obtain, then the interests of the patient are best subserved by simple irrigation, gauze packing and drainage, leaving an open wound to close by granulation.

Dr. Clifton Mayfield contributes a paper on

Cerebral Hemorrhage in Children.

As far as *preventive treatment* is concerned, the indications are very plain. Prevent injury to the meninges by avoidance of prolonged pressure upon the head of the child during labor. Pressure by forceps, in capable hands, is likely to do less injury to the head than will follow its prolonged compression in the pelvis, especially in breech cases. Likewise avoid, as far as possible, cerebral congestion, the result of compression of the cord or too long delay in establishing respiration.

In the attack, the convulsions add greatly to the danger by augmenting the already existing congestion, thereby increasing the hemorrhage. To control the spasms, chloroform is indicated as the most efficient agent; or, in its stead, chloral may be given. During this time, but more especially after the subsidence of the convulsions, the bromides in full doses are of service in preventing a recurrence.

Thorough evacuation of the bowels and absolute quiet, with counter-irritants to the limbs, cups or leeches to the neck, and cold continuously applied to the head, comprise about all the remedial agents at our command that will prove of service during the acute onset.

In the after-coming stage of palsy, attention must be given to the general health. Cod-liver oil and tonics, with laxatives when necessary, are all that will be needed in drugs, except when syphilitic treatment is indicated. Electricity, massage, and rhythmical gymnastic exercise will often work wonders in restoring tone to the affected limbs. When the contractures are marked, some form of mechanical appliance will be necessary to place the limb in a position to make its use possible. Mental defect must not be overlooked, lest efforts to force a mind, not equal to the tasks put upon it, may retard, rather than hasten, intellectual development.

The Uselessness of Drainage in Abdominal Section for Tubal Diseases, etc.,

is the title of a paper by Dr. Wm. R. Pryor. After discussing the tolerance of the peritoneum to foreign bodies he says:

The only sepsis the drainage-tube removes is that which is introduced by the operator, and the only irritating fluid drained away by it is what he has put in.

The results of the use of the drainage-tube are—

1. Possible infection of the wound.
2. Probable ventral hernia.
3. Inevitable binding together of the intestines by adhesions.

He strongly urges the Trendelenberg position, as by its means the operator can see what he is doing and does not have to trust entirely to the delicacy of his touch.

Some cases must be drained, but not by a small glass tube. Such are cases where breaches are made into sound tissue, where the unclean vagina or bowel is opened, and cases which have been previously tapped. With the possibility of seeing what we are doing, such accidents are rare.

Dr. Henry W. Stelwagon contributes an article on

Alopecia Areata; Vitiligo; Herpes Zoster; Pruritus;

being the notes from ten years' service at the Philadelphia Dispensary for Skin Diseases. In the cases of alopecia, the treatment was in every case, both by constitutional and local medication; the former in the line of improving the nerve tone, with such remedies as arsenic, strychnia, phosphorus, quinia and iron; and the latter having in view the production of a mild, persistent irritation, with such applications as sulphur ointment, oleate of mercury ointment, five to twenty per cent. strength; naphthol ointment, a half to two drachms to the ounce; tarry oils and salves; weak chrysarobin ointments, ten to forty grains to the ounce; tincture of cantharides, and the like.

In regard to vitiligo, no new information bearing upon etiology was discoverable. In one or two cases, the disease retrogressed slightly while under observation. Treatment consisted mainly of such alteratives as strychnia, phosphorous, arsenic and iron, pilocarpin was tried, but with no perceptible effect. In herpes zoster, the object of all local treatment was the protection of the affected region, and consisted variously of the free use of a dusting powder, over which was placed a layer of cotton; of salicylated oxide-of-zinc ointment applied constantly as a plaster; and in those instances in which the disease was of an abortive type, the lesions scarcely reaching active vesiculation, a simple covering of cotton or patent lint was advised. In sore or neuralgic cases, an ointment containing small quantities of opium and cocaine was spread over the parts. In a few cases, the protection was afforded by coatings of flexible collodion.

As to the etiology of pruritus, in a few instances, diabetes or albuminuria was the suggestive factor; in many, gastric and intestinal indigestion; in some, the lithic acid diathesis; but, in the large proportion of cases, it was difficult to find any explanation of the pruritus beyond the acceptance of some obscure functional perversion of the cutaneous nerves.

Constitutional treatment was varied according to indications; in many cases, free action of the bowels, some regard to diet, and the administration of an alkali, such as the sodium or lithium salts, had a curative influence. Small doses of atropia sometimes acted quickly. Among the most valuable of external applications advised, may be mentioned—carbolic acid lotions, thymol lotions, resorcin lotions, liquid carbonis detergens diluted with several or more parts water, and alkaline lotions. In those cases of pruritus of the legs, in which the skin was harsh and dry, relief was afforded by mild salicylated ointments. In the localized forms, cocaine and menthol ointments and lotions were of value.

Dr. F. B. Bishop discusses the subject of

Treatment of Organic Stricture of the Urethra by Electrolysis.

He states that after a constant experience of eight years, he is thoroughly convinced that the treatment of organic strictures of the urethra by electrolysis is the best method known to the profession. It requires an experience gained by daily practice, great gentleness of manipulation, and lots of patience and perseverance. He reports two cases in support of the claims of his paper.

Dr. Wm. C. Dabney contributes a paper on

Neuritis,

discussing its frequency, causes, symptoms, diagnosis, prognosis and treatment. The most common cause, in its milder forms, is cold or exposure. A second cause is found in injuries of a nerve. Another cause is diabetes, but as a general thing the sciatic nerve only is affected and the cases are considered neuralgic. The diagnosis of neuritis from neuralgia is sometimes easy and sometimes extremely difficult. The distinctive features are (1) tenderness along the course of the nerves in neuritis, which if present at all in neuralgia is far less marked; (2) the motor, electrical and trophic disturbances which are absent in neuralgia, are often present in neuritis; (3) the persistence and long duration of neuritis. The diagnosis from anterior-poliomyelitis is readily made by the absence of sensory disturbances in the latter affection. From myalgia, it can be generally distinguished by the absence or much less degree of pain on movement in neuritis than there is in myalgia. Furthermore, in myalgia there is no tenderness along the course of the nerves. The treatment is chiefly addressed to securing rest and relief from pain. Rest is of the greatest importance.

In the rheumatic cases the salicylates or salol and counter-irritation have given better results than anything else. When the pain is severe, galvanism sometimes gives relief. *Hot* applications are often grateful, but care should be exercised in their employment. The modern analgesics, antipyrin, acetanilide, phenacetine, etc., will often give relief, but frequently only when large doses are used, and then are not perfectly safe.

After the acute stage has passed, tonics are of great benefit.

Massage is also useful in these cases, but he doubts whether electricity is of much value at any stage of the disease, except in the form of galvanism in the early stages, to relieve pain.

Dr. Henry L. Myers reports "A Case of Syphilitic Iritis with Complications—Recovery." The treatment persued was as follows:

A 1 per cent. solution of sulphate of atropiæ was dropped into the eyes several times daily. Hot applications in the form of poultices and hot baths were used at short intervals during the day. Inunctions of mercurial ointment were practised night and morning until the patient was brought to a point a little short of salivation. Increasing doses of iodide of potash were administered three times daily, to toleration. The bowels were kept active with salines.

Dr. Luther Sexton reports a case of "Dysmenorrhœa cured by Dilatation, Curetting, and Iodoform Gauze Packing."

Other articles in this issue are: "Notes on Cataract Extraction," by Dr. W. H. Bates; "Summary of Electro-therapeutic Work in a Private Hospital," by Dr. G. Betton Massey; "Belt and Pad, as applied to the Præcordial Area, Scrobiculus Cordis, Pit of Stomach, in Concussions and Relaxations of the Heart," by Dr. Henry V. Gray; "The Qualitative and Quantitative Analysis to determine the Presence and Amount of Sulphurous Acid Gas absorbed by Rags Disinfected with Sulphurous Acid Gas," by Dr. James C. Kellog; the remaining paper is by Dr. Elliot T. Brady on "Perversion of Sexual Instinct—Sadism in Southern Negroes—Its Remedy, Castration."

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES

for June. Dr. Landon Carter Gray contributes a paper entitled

Cases that should be Operated upon by Craniectomy.

The causes of mental defect in children he considers to be: Porencephalitis; meningitis and meningo-encephalitis; hemorrhage; either diffused or localized; trauma; hydrocephalus; myxœdema; possible premature ossification of the skull, mainly in the region of the sutures and fontanelles. Of all these causes of idiocy, only the premature ossification of the sutures and fontanelles, recent traumatic injuries, and hemorrhages can possibly be benefited by a craniectomy, for porencephaly, meningitis, meningo-encephalitis, and myxœdema are lesions that the surgeon's knife cannot affect in any way.

Dr. Leo Steiglitz and Dr. Arpad G. Gerster present the report of

A Case of Cystic Tumor of the Brain operated on with Success.

The most noticable feature of the case was the absence of general cerebral symptoms. Dr. Gerster, in discussing the technique of craniotomies, says that the safety of the operation depends upon absolute cleanliness. He has abandoned the old crucial incision for a flap incision of generous proportions, so arranged that its shape will aid drainage in the recumbent position of the head. To avoid hemorrhage from the scalp, the incision is clamped around its entire margin; the clamps being removed one after another as the occluding sutures are introduced. He also uses the mallet and gouge in place of the trephine, as in this way the cutting is more under the surgeon's eye. As soon as enough of the inner table has been gouged away to admit the beak of the rongeur forceps, the gouge is laid aside and the apperture enlarged with the rongeur. To control hemorrhage from the vessels of the diploe he uses the following expedient: The point of a narrow bistoury or tenotomy knife, or of a small drill, is inserted into the bleeding orifice, and is driven into it with the motion of a gimlet, one-half or a whole rotation being sufficient to detach the vessel from the walls of its bony canal, and to cause its retraction. This plan he considers better than the use of plugs of wax, catgut or pith. Attempts at the removal of the lining membrane of cysts or abscesses will usually fail and may lead to serious injury of the brain substance. The removal of tumors will have to vary according to their nature; if encapsulated, their enucleation by the point of the finger, or a blunt instrument, will be easy. Infiltrating neoplasms should not be meddled with; caseous or granulating deposits of a tuberculous or syphilitic nature will admit of the safe use of a curette, by which such of their portions should be scooped away as will readily yield. Hemorrhage from these cavities will be checked by iodoform-gauze pressure.

Dr. D. S. Lamb presents the results of his investigations of

The Meckel Diverticulum.

He takes exception to the use of the words *true* and *false* to distinguish Meckel's diverticulum from the other pouches sometimes found as the result of hernial protrusions. The hernial pouches had better be called hernial pouches, and not false diverticula, because they are not false diverticula. He tabulates the results of his investigations in 109 cases. He also calls attention to the fact that these diverticula may seriously endanger life from invagination; foreign bodies may lodge there; typhoid ulceration may occur. When it has a cord, the outer end of which is attached to some other part of the abdomen, this may cause strangulation of the intestine. It may lodge in a hernial sac and cause fatal disturbance. Where the duct extends all the way to the umbilicus, and the latter is patulous, feces may be discharged from this opening.

Dr. M. H. Richardson and Dr. T. G. Mumford contribute a paper on

Dry Aseptic Operating.

After reviewing the objections to antiseptic operating, the authors describe the following procedure: Antiseptic solutions should never come in contact with the wound, but may be used to render the region to be operated on aseptic. Dressings, instruments, sponging-gauze, sutures, and ligatures are sterilized by heat. They advise the use of a second knife after the skin has been incised. The hands

of the operator and his assistant should never come in contact with the wound; the use of intervening strips of gauze between the flaps, or wound, and the hands of the operator and assistant prevent the contamination. In place of sponges, the authors use packing of sterilized gauze. Instead of mopping, they tampon. So far as the free use of the knife will allow, the cut surfaces and edges are packed rapidly with gauze, which is left behind as the surgeon advances. All vessels, except those of considerable size, are thus controlled, the large bleeding-points being caught, of course, by pressure forceps. The result is that when the work of the knife is completed, the wound remains securely tamponed. The gauze must then be held firmly in place for a few minutes, and on its removal a clean and absolutely dry wound is disclosed. Torsion and a few fine silk ligatures complete the hemostasis absolutely. The authors claim that this method is of advantage not only in clean wounds but also in suppurating, tuberculous and septic cases. They also advocate its use in abdominal operations. The authors have performed in this manner 130 major operations, of which number only one, a case of double pyosalpinx did badly. In that case the abdominal wound failed to heal by first intention. The patient recovered.

Other papers in this month's issue are: "The Disease Process, Glaucoma," by Dr. S. O. Richey; "Thrombosis of the Femoral Vein in Phthisis" by P. R. Dodwell, M. D., M. R. C. P. Lond.; and "Asiatic Cholera" by Dr. Charles A. Leale, in which article he describes the recent threatened invasion of New York City. He protests against daubing the outside of a trunk of perfectly clean articles, and calling that disinfection, while shiploads of dirty rags are admitted.

PERISCOPE.

THERAPEUTICS.

Anæsthetics.

Dr. Hare, in *N. E. M. Monthly*, says: A point of very great importance in connection with the nse of anæsthetics is the position of the diaphragm and its functional activity. I have been able to foresee danger by watching this muscle, when the examination of the ordinary respiratory act as a whole would fail to show any abnormal changes. So much has recently been before the profession as to the functions which first give us danger signals that this point becomes the more interesting and valuable. It is an invariable rule, under the influence of ether at least, that the first evidence of the full effect of ether is seen in the diaphragm. As soon as the movements of this muscle become abortive or irregular, it is time to stop the anæsthetic. Of course, this only applies to the case which has passed the early stages of struggling, when the struggles may readily interfere with all the muscles of respiration. The movement of the diaphragm which forbodes ill, is, as I have said, an irregular, to-and-fro, flapping movement, the reverse of the normal; for in the normal the belly-wall protrudes in inspiration, and recedes on expiration.

Another point of great importance, not only in the treatment of persons suffering from the over-effects of anæsthetics, but in the case of the other accidents, is the use of heat. This was first impressed upon me forcibly by some studies made on the dog and on man in 1888, and later by further observations on man. I found that it was possible to lower the bodily temperature of the dog many degrees by prolonged anæsthesia, and that in man a fall amounting to four degrees might occur in comparatively brief operations, even when little or no blood was lost. I had hardly made these observations before I had a striking example of care in scientific study exceeding care in ordinary surgery. Visiting Victor Horsley's laboratory in the Brown Institution, I saw a monkey upon whom a brain experiment was being performed, lying unconscious in a water-bath, and well covered to retain his heat. This, I was told, was practically a necessity for the survival of the monkey and the success of the work. The next day, however, I found that in operating on the human brain no such precaution was taken. The application of heat about the body of a person undergoing an operation is of the greatest importance, and its use after the operation stultifies the operator, who forgets the old adage, "An ounce of prevention is worth a pound of cure." Care should be taken that the heat is not too great, and that artificial heat-stroke is not brought about. The same facts hold good in regard to cases of hemorrhage or shock.

ARMY AND NAVY.

U. S. ARMY FROM JUNE 3, 1893, TO JUNE 17, 1893.

APPOINTMENT.

Lieutenant Colonel George M. Sternberg, Deputy Surgeon General, to be Surgeon General with the rank of Brigadier General, May 30, 1893.

PROMOTION.

Major John H. Janeway, Surgeon, to be Deputy Surgeon General with the rank of Lieutenant Colonel, May 31, 1893.

RETIREMENT.

Brigadier General Charles Sutherland, Surgeon General, May 29, 1893.

By direction of the Secretary of War, the order relieving Major John Brooke, Surgeon, from duty at Fort Leavenworth, Kansas, and assigning him to temporary duty as Attending Surgeon, and Examiner of Recruits at Philadelphia, Penn., is revoked.

Leave of absence for twenty-one days, to take effect on or about June 15, 1893, is granted Captain Louis S. Tesson, Assistant Surgeon.

The extension of leave of absence on account of sickness granted Captain Marlborough C. Wyeth, Assistant Surgeon, U. S. Army, is further extended two months on account of sickness.

Leave of absence for one month, from July 1, 1893, is granted Captain George T. Beall, Medical Storekeeper, U. S. Army.

First Lieut. George D. DeShon, Assistant Surgeon, U. S. Army will proceed to Chicago, Illinois, and report in person to Captain Louis A. LaGarde, Assistant Surgeon, in charge of the Medical section of the War Department exhibit, World's Columbian Exposition, for such duty as may be required of him in connection with said exhibit.

Leave of absence for fifteen days, to take effect about July 1, 1893, is granted First Lieutenant Paul F. Straub, Assistant Surgeon, U. S. Army.

The leave of absence for seven days granted Captain Edward Everts, Assistant Surgeon, U. S. Army, is extended twenty-three (23) days.

Leave of absence for two (2) months, to take effect on or about July 1, 1893, is granted Colonel Charles T. Alexander, Assistant Surgeon General, U. S. Army.

Leave of absence for one month, to take effect about the first proximo, is granted Major Washington Matthews, Surgeon, with permission to apply for an extension of one month.

U. S. MARINE HOSPITAL SERVICE FOR THE FIVE WEEKS ENDED JUNE 10, 1893.

Baillache, P. H., Surgeon, granted leave of absence for four days, May 22, 1893.

Purviance, George, Surgeon, detailed as chairman Board of Examiners, May 8, 1893.

Hutton, W. H. H., Surgeon, granted leave of absence for ten days, June 1, 1893.

Hamilton, J. B., Surgeon, granted leave of absence for four days, June 1, 1893, granted leave of absence for seven days, June 7, 1893.

Gassaway, J. M., Surgeon, detailed as member Board of Examiners, May 8, 1893.

Stoner, J. W., Surgeon, to represent the Service, at meeting of American Medical Association, June 2, 1893.

Irwin, Fairfax, Surgeon, to proceed to Marseilles, France, for duty, May 16, 1892.

Carter, H. R., Surgeon, detailed as recorder Board of Examiners, May 8, 1893, to report in Washington, D. C., for special temporary duty, May 20, 1893, to proceed to Delaware Breakwater Quarantine for temporary duty, May 31, 1893, to proceed to Baltimore, Md., for temporary duty, June 2, 1893.

Carrington, P. M., passed Assistant Surgeon, to proceed to Bremen, Germany, for duty in office of U. S. Consul, May 16, 1893.

Kinyonn, J. J., passed Assistant Surgeon, to proceed to Chicago, Ill., for special duty, May 8, 1893.

Goodwin, H. T., passed Assistant Surgeon, to proceed to Detroit, Mich., for temporary duty, May 27, 1893.

Sterner, J. B., passed Assistant Surgeon, granted leave of absence for twenty days, June 5, 1893.

Geddings, H. D., passed Assistant Surgeon, to proceed to Reedy Island, Del., for special duty, June 7, 1893.

Condict, A. W., Assistant Surgeon, granted leave of absence for three days, June 5, 1893.

Nooman, Seaton, Assistant Surgeon, granted leave of absence for six days, May 12, 1893.

Summer Excursion Tickets.

To all Northern and Eastern seaside, lakeside, and mountain resorts, to Deer Park, and Oakland, the Virginia Springs, Niagara Falls, Luray Caverns, Gettysburg, and to all other points where people gather in search of health and pleasure, are now on sale at all Baltimore & Ohio ticket offices at greatly reduced rates. These tickets will be sold from June 1 to September 30, and are valid for return passage until October 31. Before selecting your route or resort consult B. &. O. summer excursion book, in which shortest routes and lowest rates, via "Picturesque B. & O." to all resorts are given from points on that road east of the Ohio River; profusely and artistically illustrated. This book can be procured free of charge upon personal application to ticket agents, B. &. O. R. R. Co., or you can have it mailed to you by sending name and address with 10 cents in stamps to Chas. O. Scull, Gen'l Passenger Agent, Baltimore, Md.

To the World's Fair Via B. & O.

GOING VIA WASHINGTON AND RETURNING VIA NIAGARA FALLS.

The Baltimore and Ohio Railroad has placed on sale at its offices throughout the East excursion tickets to Chicago, good going via Washington and returning via Niagara Falls, with the privilege to stop over at each point. These tickets are valid for return journey until November 15th, and are not restricted to certain trains, but are good on all B. & O. trains, and permit holders to travel via Pittsburgh or via Grafton. By either route passengers cross the Allegheny mountains, 3,000 feet above the sea level, amid the most picturesque scenery in America. Sleeping car accommodations may be reserved in advance upon application to nearest B. &. O. ticket office.

MONOGRAPH SERIES. NO. 1.

SEXUAL FUNCTION AND INSANITY.

JOSEPH PRICE, A. M., M. D.,
PHILADELPHIA.

The growing circle of comparatively young, yet earnest men of the profession, welcome the awakening of an epoch in medicine and surgery. Our chief pride is that the decree is spurned which would determine for us that we have exhausted the resources of our science and art. There is herald of greater victories than yet gained in the fact that we will not brook servility to the traditions of an ended age. We will tolerate no bondage to the theories of the best genius of the past. They made soil for us in which to plant the seeds of new growths and to the cultivation of which we will apply our improved methods. Time and progress make "an ancient good uncouth." We have no time nor spirit for listening to echos. Let those who love to cling to apron strings, (Paps' Boys), play innocently amid Ancestral shadows, but let there be no restraint upon the impulse, the rugged purpose of those who would have a freer atmosphere for our advances, a larger firmament, and a new and more promising future.

For centuries insanity, even by the most eminent scientists, was considered only from a psychical standpoint. Even yet the alienist insists that you cannot restrain, change or give different direction to these psychical processes, that they are peculiarly and exclusively of the brain—that both cause and effect are prisoned within the cranium. He obstinately refuses to recognize that there is much wrapped up in the mysteries of insanity which the gynecologist could aid him in unraveling. Gynecology is not a branch the Alienist cultivates and he is slow and reluctant to receive its stern lessons. It has been only within the last decade that the bolder, more progressive spirits of the profession have entered into this forbidden field.

We are not at all disposed to question the existence or underestimate the force of psychical influences. Our human science fails to reveal to us their occult working, yet they have for us many lessons worthy of profound study. Nor would we set up the claim that surgical interference will effect cure in all or even the majority of cases where there is disease of sexual organs, but we feel assured that it will in many.

We have a right to expect much in the future from our present and rapidly growing knowledge of the pelvic organs and their functions. We will grow to even better knowledge when to interfere with the pelvic organs and when to let them alone. Diagnosis is not perfect. Even with those with the most successful experience there will continue to be mistakes, but our art has and will continue to improve with the broadening of our experiences. Cases are rapidly multiplying that sustain the claim that a great number of cases of insanity in women can be relieved and absolutely cured by gynecological treatment. We have great numbers coming to us every day with their disorders and sufferings who go away cured, and by every right and claim of humanity the insane are entitled to have the same relief extended to others—if not for mental cure for the relief of physical suffering. They should not be permitted to suffer double afflictions, mental and physical.

Allow for all the factors that face upon us as the chief promoters of mental disturb-

ances and still there remains in very many cases unexplained causes, unless we take into account diseased physical organs. Conclusions from mere psychical phenomena is not satisfying and does not lead to advances in the line of treatment.

That there are causes of insanity outside the cranium is no longer a controverted question among scientific men—those who have given the subject studious, scientific investigation; those who have studied the relation of disease to mental conditions. That there is not more light upon the subject, more relief given and cures affected in our insane asylums is largely due to the inertia, if not indifference, of certain Hospital Authorities.

There is always in such bodies a little biped, jumping-jack minority, who will travel more miles for a good dinner at the expense of some charity, than they will feet for a practical idea or to carry forward some practical and humane work. They will not do themselves, nor let others do, who have a high appreciation of official and professional duty—an intelligent and conscientious sense of the responsibilities of their work. The physicians in charge of these hospitals are usually men and women of tested ability, of noble aims; but there is too much put upon them, both of work and responsibility, and they do not receive that moral support and encouragement they should in a work that tests every faculty of mind and every element of bodily strength. The need is of more help, both of skilful physicians and trained nurses. When there is neglect it is not generally the fault of those in professional charge, their duties are too many and too varied for them to efficiently discharge them all with that completeness which is due to these unfortunate sufferers.

Fitness by thorough education in special lines is not enough considered. This should apply as well to nurses as to medical attendants. The victims of mental maladies require at all times either medical or surgical treatment, and at all times careful, expert nursing. In few other kinds of nursing is there such urgent need for special training.

The work is not one eagerly sought after. It is taxing, bodily and mentally; it is a work in which those employed grow into expert discharge of their duties.

And let me add that very few gynecologists would be specially ambitious to exercise their calling in a lunatic asylum. In no other sphere would there be such weight of professional responsibility, such a burden of anxiety, such need for sleepless watch. These sadly diseased people are, so far as their legal or other responsibility goes, but children; they are the child-wards of the State. This fact greatly augments the responsibility of those made officially their care-takers. There should be a gynecologist, oculist, and other important specialists represented in each and all these institutions. The field of needed treatment is too broad for any one man's mastery. It has been demonstrated that the gynecologist can aid in restoring many of these unfortunate victims of the most dire calamity that can befall one of our human kind to complete cure or to better mental balance by the surgical treatment of diseased organs. They understand the causal relation accidents incident to parturition bear to disturbances of the nervous system. It must be recognized that there are troubles without the domain of medicine and within that of surgery, requiring surgical means of investigation and surgical means of treatment.

Dr. Thomas Savage in an address delivered in the obstetrical section of the British Medical Association says: "There is one more point I should like to refer to, and that is the necessity that exists for most and certainly all large lunatic asylums, to have a gynecologist as a member of their medical staff. Among the causes of insanity in women, heredity, intemperance and the vicissitudes of female life are said to be most frequent, and it has occurred to me, as I know it has to others, that in regard to the latter element as a cause, much good might result if every case in which there was the least doubt, were thoroughly overhauled and investigated by an experienced gynecologist."

There can scarcely be any dispute of the statement that there are now a large number of child-bearing women confined in our insane asylums into whose condition no special inquiry has been made. Their trouble has loosely been regarded as simply one of loss of reason or mental

balance without a moment's inquiry as to primary causes. Uterine and ovarian disease are quite as common in this class as among the sane. Unfortunately as yet we have found no class exempt.

With the view of throwing light upon the subject, a subject that, by virtue of its grave importance, needs all the light that can be thrown upon it, we will give a consensus of the opinions of the most eminent men of the profession of Europe, in connection with those of our own country who have given the subject the most careful, thoughtful, patient and laborious inquiry.

Dr. Barnes, one of the most eminent surgeons of England, formulates the three following questions:

(1) Did the sexual disorder declare itself first?

(2) Did the nervous disorder declare itself first?

(3) What are the mutual reactions of these two disorders?

And if we trace anticedence of the sexual disorder, can the nervous disorder be traced to the sexual as a cause, or *vice versa*? These questions place the subject in line of direct and intelligent inquiry and open a very wide field of scientific and clinical study.

So very valuable do we consider Dr. Barnes' very thorough study of the subject that we shall quote freely from one of his very able papers, satisfied that his conclusions are of great practical value and will serve an educational purpose, do much to enlighten that class of alienists whose prejudices are stronger than their reasoning.

Dr. Barnes says: "Even if not directly causative, serious sexual disorders cannot fail to be an aggravating factor of the nervous disorder. It must be granted that no satisfactory solution can be attained without bringing to the inquiry thorough all-round diagnostic skill. Before recent advances of gynecology, women sane and insane had to suffer from ills now known to be curable. In studying the correlations of mental and sexual phenomena, we are struck by the double light thrown upon the problem by the application of surgery. The immediate design of surgery is the relief of suffering. Gynecology is largely surgical, and the true solution of its most important problems is revealed by direct appeal to surgery. It teaches physiology, the rational basis of the healing art; it demonstrates pathology at the same time that it heals. The surgeon learns, the subject gains life and health. Has this enlightening and beneficent surgery been fairly applied to the study of the physiology and pathology of women, or to the relief of women secluded in lunatic asylums.

When a complicating factor intervenes, as neurotic diathesis or disordered action of the sexual organs, the equilibrium is lost, and nervous disease may be provoked. If we pass to the neurosis that attend morbid conditions of the uterus and ovaries we get even more striking evidence of causation.

A *frequent state is displacement* of these organs, not necessarily diseased in tissue.

The most common is retroflexion or retroversion, with or without prolapsus of the uterus. These can hardly exist without entailing some disorder of menstruation, and this is enough to disturb the nervous equilibrium. But in addition to this, the displaced organ presses upon other organs, as the bowel and bladder, impeding their functions, and especially if it presses upon the sacral plexus, and so causes constant irritation of the lower segment of the spinal cord, a part of the nervous system, as we have seen more highly organized than it is in the male. So-called sympathetic, reflex or diastalic phenomena are frequent. In not a few instances these minor nervous disorders culminate in melancholia and mania. I have the history of cases in which the subjects had been insane for long periods, with no sign of amendment until they came under my care. I discovered pronounced retroflexion with hyperplasia of the uterus. This being corrected by surgical treatment, rapid recovery ensued. In one most striking case the subject returned to her home, bore twins, and has since been in perfect physical and mental health. Dr. Bennington reports a case to the British Gynecological Society equally remarkable. Schweder Vander Kolk relates a

case of a profoundly melancholic woman who suffered from prolapsus uteri, in whom the melancholia used to disappear directly the uterus was restored. Fleming mentions two similar cases in which the melancholia was cured by the use of a pessary, in one of them returning whenever the pessary was removed. In one instance, says Dr. Mandsley, I saw severe melancholia of two years' duration disappear after the cure of prolapsus uteri. It is probable that inversion of the uterus entails pressure upon the ovaries and disturbance of their function. Similar examples of nervous disorder have been observed in connection with displacement of the ovaries. Occasionally one ovary sinks down in Douglas' pouch, getting below the level of the uterus. Severe nervous symptoms follow, and have been relieved by maintaining the ovary in its proper place, or by removing it.

Trouble is especially liable to occur when the ovary is enlarged to the size of an orange or even less. In such a case removal by operation is clearly indicated. The influence of disease of the ovaries is not less remarkable.

Do we not see in these facts proof that these organs exercise a motor and governing power over the nervous centres. It seems more rational to look for freedom from mental disease in those women who have undergone a succesful operation for the care of an ovarian or uterine disease. Such diseases we know are apt to entail nervous disorders, and we have seen that the nervous disorders, when complicating disease of the sexual organs, are frequently cured when the diseased organs are removed."

Dr. Savage reports a case in which profound melancholy was associated with prolapsus of the uterus, and the patient had been restored to health within twenty-four hours of the relief of the conditions. Dr. Bantock reports the case of a woman who for nine years had been the subject of a form of melancholia. She had tried every kind of treatment until she came under the notice of Dr. Marion Sims, who after examination at once said he thought the patient could be cured. She was taken to Europe and Dr. Bantock confirmed the opinion of Dr. Sims, and an operation was agreed upon. It was performed by Dr. Bantock and revealed "the ovaries in that peculiar condition which resembled a deformed bunch of grapes, very little larger than the normal, they were evidently extensively diseased. Within two months the patient was quite restored to health, and she had remained well ever since. There the connection between the ovarian lesion and the mental disturbance was clear and indisputable."

Dr. R. T. Smith, an English surgeon of unquestioned ability, in reporting a case where he had removed the ovaries says: "In the whole round of the various kinds of treatment which need to be adopted for the diseases which come under our notice as gynecologists, there is none which causes more thoughtful and anxious consideration than the use of surgical procednres for nervous disorders. From this case we may deduce this lesson, that while hysteria is frequently a disease that may be safely left to moral and general treatment, it is also sometimes a very serious disease in itself, and demands energetic and indeed surgical interferences."

Dr. Barnes in discussing this case "inquired whether the cases reported by Gull, Fagge and others, of hysteria without local disease, had been examined in the presence of a gynecologist; otherwise he would demur to accepting those cases as proof that hysteria could arise independdently of pelvic disorder, when properly treated by local measures hysteria often disappeared. The statement that such cases often required surgical treatment was full of truth and hope."

Dr. Bantock in referring to Dr. Smith's case said: "He did not know that it was necessary to justify the operation that they should have very distinct evidence of disease in the ovaries, what they regarded was the association of these attacks with some condition of the pelvic organs and particularly of some association with the menstrual function."

Dr. Bucknell: "There can be no doubt that uterine disorder constitutes one of the most frequent remote causes of insanity with which we are acquainted. Dr. Esquerol: "Menstrual anomalies make up a sixth part of the causes of insanity, "Dr. O. G. Pfaff reports a case of insanity

cured by removal of double pyo-salpinx, patient returned to her home in a month and continued to improve until cured.

Among American physicians and surgeons who have taken advanced ground on this subject, energetic, progressive men who are not in bivouac or barrack but on the march we are glad to name Dr. George H. Rohe, Dr. I. S. Stone and Dr. C. A. S. Reed.

Dr. Rohe says: "Every gynecologist has had within his own experience cases of neurosis, persistent pain, psychical depression not amounting to melancholia, "nervousness," hysterical manifestations, etc., which he has found to depend upon some lesion in the pelvic organs. I venture to say that no form of treatment gave such prompt results in these cases as the surgical, whether that consisted in the ablation of the uterine appendages, extirpation of the uterus, the repair of cervical lacerations, or the restoration of a ruptured perineum. At all events, I do not hesitate to say that this has been my own experience with women outside of an insane hospital."

In a personal communication under date "of January 24th,1893,Dr. Rohe writes:—So far as my abdominal cases are concerned I have now done 22 sections here—20 with removal of the appendages and two exploratory. Four of the cases have been discharged recovered and are still well. One other is so much improved that she has been given leave of absence and has now been at home over three months. I hear from her regularly and judging from the reports I receive I will soon be able to discharge her also. Two of the cases (epileptics) died, one from septicemia,—a large collection of abscesses in the ovaries and tubes,—and one other also from septicemia, although death occurred in status epilepticus. None of the cases have been made worse. In nearly all there has been mental improvement. In all there is physical improvement. This would naturally be expected as the operation was nearly always done for sufficient physical disease to demand it irrespective of the mental condition. I observe that Dr. Alice Bennett has been interfered with in her work at Norristown. I regard that as a great outrage, and hope the profession in your State will express itself in positive tones upon this system of regulating the practice of medicine."

Dr. I. S. Stone makes the very pertinent inquiry: "Can the Gynecologist aid the Alienist in Institutions for the Insane? This question, he says, should receive an affirmative answer without debate. The question is asked by the Gynecologist briefly thus: Are there not in every community of from one hundred to five hundred, many cases of uterine or pelvic disease? Is it not true that in a community of five hundred sick women, sick mentally often because of bodily infirmity, that the statement should be doubly true? We claim that very many more pelvic causes of insanity exist than are found, owing to the difficulty of making a diagnosis in these cases. No fact is better understood than that any disease of the abdominal organs may favor insanity even by interference with nutrition alone. How much more does it seem probable that disease of the organs peculiar to women, which so much more than the corresponding organs in men, have to do with her physical and mental condition, may cause psychical derangment."

Dr. C. A. L. Reed speaks plainly and gives the conclusions of a student of the subject in all its bearings:

"A gynecologist has at last been appointed the medical officer of a hospital for the insane. He has dispelled several illusions which have been imposed upon the profession and the community by the old and, unfortunately, yet existing *regime.* In the first place, he has found that these patients can be examined without injury to themselves; in the next, that diseases of the intrapelvic organs can be as readily diagnosticated in their cases as in others; that they can be operated upon as readily and with as good results as sane patients; and, finally, that after primary recovery from abdominal section, a very encouraging proportion of them recover mentally; and, still lastly, that among the most happy mental recoveries are cases that have been incarcerated for years and labeled as incurable. I invite the attention of the profession to the magnificent work being done in this direction by Dr. George

H. Rohe, of the Maryland Hospital for the Insane. When asylums become organized as hospitals, with staffs as specialists in the various departments in attendance, we shall realize the maximum of recoveries in these institutions."

The frequent association of hysteria with disease of the appendages is generally admitted. Yet it is not maintained that there should be resort to surgical procedure in every case of hysteria. There should be clear indications, a recognized asssociation of mental disease with sexual disorder.

Some of our best authorities doubt the existence of hysteria independent of pelvic disorder. In a discussion before the College of Physicians, December 4, 1889, Dr. S. Weir Mitchell said he "agreed with Dr. Price in regard to this operation in hysterical women. Many who had both ovaries removed and were none the better for it, seemed to constitute the most irremedial of all the cases of hysteria. There is one condition which makes it justifiable to operate on healthy ovaries. That is where a woman, passed the age of probable marriage, is insane only at the menstrual period. IT two such cases removal of the ovaries was done at his request by Dr. Goodell. One was a case of homicidal mania at the menstrual periods, and the other case was one in which were developed extraordinary sexual appetites in a woman at other times modest. In both of these cases the recovery was absolute."

Dr. Marie B. Werner, a specialist and skillful diagnostician, made a series of examinations of patients in the Norristown Asylum during the Spring of 1892, and her careful summary (MEDICAL AND SURGICAL REPORTER, Dec. 31, 1892,) of what she found in thirty cases has great value as giving in succinct form an analysis of the many and varied troubles she encountered, with brief reference to their history, where such could be obtained:

CASE I. Melancholia, following last labor, vagnia examined; *small mass in right pelvis space; prolapsus of uterus; lacerations of cervix and perineum.*

CASE II. Acute Melancholia. First attack supposed to have been induced by the establishment of puberty; second attack followed third labor; *uterus fixed posteriorly; mass to the left;* right ovary prolapsed.

CASE III. Acute Mania. Attack sudden, in August, 1891; patient aged forty-seven; vagina examined; uterus drawn to the left; *painful mass on right side;* cyst of right labia; complains of pain down legs when walking.

CASE IV. Melancholia. Second attack, vagina examined; uterus anteflexed; *masses both sides.*

CASE V. Mania. Vagina examined; uterus retroverted and fixed; body large, cervix small; rectal examination reveals *masses on both sides.*

CASE VI. Melancholia. Three months after birth of child. *Uterus retroverted and fixed; external hæmorrhoids.*

CASE. VII. Melancholia. Uterus enlarged, *fixed to the left; mass on right side;* cystic degeneration of cervix.

CASE VIII. Mania. Multinodular Uterus; *masses on the right side* with tenderness; cystic degeneration of cervix, and bleeds to touch.

CASE IX. Mania. Uterus enlarged; some *impaired mobility;* cervix cystic and eroded.

CASE X. Mania. Last labor occurred six months before admission. *Uterus enlarged,* somewhat hard; moderately movable; cervix patulous; bleeds readily.

CASE XI. Chronic Mania. Brain fever marked the onset of the attack; *uterus retroverted, prolapsed and fixed;* tenderness in both pelvic spaces.

C SE XII. Mania. *Mass in right pelvic space; perineum lacerated.*

CASE XIII. Melancholia. "Was not well after last child was born." *Uterus prolapsed; laceration of cervix and perineum.*

CASE XIV. Mania. Second attack; *uterus fixed, masses on each side;* laceration of cervix and perineum; kraurosis of both vaginal orifice and vulva.

CASE XV. Mania. *Small undeveloped uterus; fundus posterior and to the left;* moderately movable.

CASE XVI. Mania. Last child July 20, 1891; placed in Friend's Asylum, August 8, 1891; uterus fixed anteriorly; *tubes tortuous and enlarged; left ovary*

cystic; laceration of both cervix and perineum; varicose veins at vulva orifice.

CASE XVII. Imbecility. Three children; last, four and a-half years before attack; *uterus fixed posteriorly; masses on both sides;* cervix patulous and lacerated; also perineum; hæmorrhoids.

CASE. XVIII. Mania. Last labor thirteen months before attack, which was gradual in onset; uterus and appendages normal; marked lateral tear of vaginal wall nearly to cervical junction, causing prolapsus.

CASE XIX. Melancholia. Onset four months after last labor; uterus prolapsed and retroflexed; *mass in left pelvic space;* movable body in right pelvic space, like the ovary.

CASE XX. Chronic Mania. Uterus atrophied; *laceration of cervix and perineum;* some cicatrical bands in vagina.

CASE XXI. Second attack. Atrophy of uterus; pelvic spaces free; some *laceration of perineum.*

CASE XXII. Melancholia. Third attack. Anteflexed enlarged, but movable uterus.

CASE XXIII. Second attack. Anteverted uterus drawn to left; *mass to the right.*

CASE XXIV. Melancholia. Cause puerperal; uterus enlarged and prolapsed; *mass on the left;* lacerated perineum; external hemorrhoids.

CASE XXV. Chronic mania. Cause puerperal; uterus fixed anteriorly, cervix large, body small and flabby. *Tender masses in both lateral spaces;* old fistulous tract to the right of the anus extending directly upward beyond the internal sphincter.

CASE XXVI. Acute mania. Second attack. Anteflexed uterus; engorged cervix and vagina; *mass on right side.*

CASE XXVIII. Chronic mania. pelvis of male type; vagina short; uterus undeveloped, fundus backward; cannot distinguish the appendages.

CASE XXIX. Mania. Fourth attack. Vaginal examination, *uterus fixed posteriorly, tender mass on left side.* Section July 3rd, 1892, removed appendages; cystoma of left ovary; right ovary undergoing calcareous degeneration; both tubes undergoing tubercular degeneration, there were some adhesions from a recent peritonitis. Patient made a rapid and uninterrupted recovery; was discharged cured five weeks after the operation.

CASE XXX. Acute dementia. Admitted 1888; vaginal examination; enlarged anteverted uterus; *mass on right side distinct;* complains of *great tenderness in left side which feels boggy.* Section, July 3rd, 1892; removed appendages; hydro-salpinx of both sides; left tube degenerated to a large cyst; dense adhesions to bowel, uterus and posterior cul-de-sac. On right side tube somewhat smaller, but tortuous, fimbriæ of both obliterated. Used drainage thirty hours; patient made a good recovery, which I understand also includes marked mental improvement.

Dr. Werner, in discussing in these cases, says: "Some operators, who have successfully dealt with multiple and single abscesses in the pelvic structures, which had given rise to periodic attacks of pelvic peritonitis and in consequence to vicious adhesions which alone often give rise to the most painful symptoms, have extended their influence and knowledge in the direction of that class of unfortunates, who often cannot understand or make known their suffering, viz., the insane. Their results have on the whole been encouraging, in so far that they have removed one source of irritation, always having in mind *to operate only in cases where disease can be demonstrated beyond a doubt.*

* * * * * *

These cases have made me feel that there is a necessity for careful study of all cases, and especially those in which the puerperal period antedates an attack. If a remote irritation can lead to insanity or epilepsy, why cannot an abscess, tubercular disease or other pelvic inflammations, also enter the field as causative factors? The claim is not to cure by operation, but by removing the irritation and thus aiding nature in restoring gradually, perhaps, its lost nerve force.

* * * * * *

It is impossible for the alienist to be a specialist in all branches of medicine; and it is a fact, that the insane are subject to all the diseases the sane are troubled

with; hence the necessity for special work in special directions. This work however should be a conscientious painstaking study of each individual case."

These are of a number of cases to which the State Lunacy Commission, by the advice of their *learned* counsellor, object to being surgically treated.

As to the legal inquiry—are we justified in operating on a lunatic who cannot give a responsible assent? Sir Spencer Wells, in one of these cases, consulted Sir William Harcourt, then Home Secretary of England, as to the legality of ovariatomy upon a lunatic. The Home Secretary said: "If she is incapable of judgment for herself, treat her as if she were an infant." So the operation was done, the patient recovered and married. This dictum, full of the very meat of good sense, given out by one of the highest authorities of England, whence I believe we have copied the most that is best in American law, should certainly not be set aside though it be in conflict with the opinion of the astute Attorney of the Lunacy Commission. Were some member of a lawyer's family affected with some hereditary mental disturbance combined with some pelvic trouble decisively indicating surgical treatment, there would be no question raised as to the legality of the procedure to remove diseased parts.

Women come to us in great numbers for the relief of disorders of the sexual organs. They come because they suffer; we surgically interfere to relieve their suffering. The insane suffer fully as much as do the sane; they are equally entitled to attention, and it is as much a duty to relieve their misery as that of the sane. The treatment of such diseases might, as expressed by Dr. Barnes, often be undertaken quite independent of any idea of curing the mental condition, but simply for the purpose of relieving physical distress.

The State, having taken these people under its protection, pledges every provision for their welfare, every means and agency of relief in the way of shelter, home care, nursing and every needed medical and surgical treatment. The insane are as strongly predisposed to uterine and pelvic troubles as are the sane, and there can be no other rational conclusion than that the results of surgical treatment would be as fortunate, from a surgical standpoint, in one class of cases as in the other. In sane cases general practitioners are alive to the importance of consultations with specialists in all cases of pelvic and uterine disease. Why the same importance of consultations does not exist in an insane case it would be difficult to explain.

The time will come, and it is to be hoped for the sake of suffering women it is not far distant, when an enlightened public sentiment will demand the opening of asylum doors to the free ingress of every agency that can cure or in any form mitigate the suffering, or make better the condition of the insane; when our asylums will not only be in charge of excellent physicians, but with skilled gynecologists and thoroughly trained and expert professional nurses,—those with a training specially adapting them to their work.

THE ETIOLOGY OF PROSTATIC HYPERTROPHY.*

G. FRANK LYDSTON, M. D.†

Few pathological conditions indeed have been the subject of a greater variance of opinion as to the etiology, than has enlargement of the prostate. The opinions of authorities have varied from the agnostic assertion that in the present state of our knowledge we are unable to determine positively the cause of the condition, to opinions as dogmatic as could be imagined. It is a noteworthy fact that most of the modern theories are fully as open to criticism as some of the more ancient views. Thus there is much of logic in the opinion of Home,[1] who, some seventy-five years ago, promulgated the theory that the principal cause of prostatic disease was a slow return of blood from the neck of the bladder, arising from the disadvantageous situation of the veins as regards their relation to the heart which favors habitual congestion of these vessels. He held the opinion that this tendency to congestion was enhanced by high living, or any other circumstances which increased the circulation of the blood in this region. Home believed that traumatism, such as is incidental to horseback riding, sometimes produced in the deeper parts of the prostate a rupture of the blood vessels which was subsequently followed by hypertrophy. This rupture of vessels he believed to be in some measure analogous to apoplexy. He also assigned to old age a prominent role in the production of hypertrophy of the prostate.

*Read before the Detroit Medical Library Association, December 9th, 1892.

†Professor of the Surgical Diseases of the Genito-Urinary Organs and Syphilology in the Chicago College of Physicians and Surgeons.

Wilson,[2] in 1881, endorsed the opinion of Home so far as the tendency to the disease on the part of high livers was concerned. He seemed to think that strict celibacy on the one hand, and venereal excess on the other, were alike potent in the production of the disease, although he admitted that exceptional cases occurred in which enlargement of the prostate developed in people who lived abstemious and temperate lives.

Sir Charles Bell asserted the existence of a predisposition to prostatic enlargement, but did not state what constituted or caused this predisposition. Admitting that such predisposition existed, he believed that the exciting causes were associated with irritation of the bladder with resulting frequent contractions of that viscus. As a consequence of these contractions of the bladder, he believed that the urethral muscles were the seat of over-action, the result of which was to draw the so-called median lobe backward in such a manner as to elevate it and constitute an obstruction to the escape of urine.

Samuel Cooper[3] frankly confessed that the causes of prostatic hypertrophy were unknown. He seemed to think from his experience, however, that people who led sedentary lives were more liable to the affection than others.

Astley Cooper[4] arbitrarily stated that hypertrophy of the prostate was the consequence of age alone, and not of disease.

Brodie[5] seemed to think that enlarged prostate was a matter of course in old men. He believed that prostatic hypertrophy never becomes manifest until plainly

marked evidences of senility developed.

The late Dr. Gross[6] expressed himself to the effect that prostatic hypertrophy might result from habitual engorgement of the organ incidental to protracted and repeated sexual intercourse; irritation from a vesical calculus; the free use of stimulating diuretics and alcoholic or malt liquors; exposure to cold; the suppression of cutaneous diseases; gout and rheumatism; traumatism; the frequent introduction of the catheter, and habitual straining at stool, as in chronic diarrhœa and other affections of the bowels.

Mercier[10] classed as predisposing causes all conditions and influences which favored sluggishness of the circulation. According to him, men of lymphatic habit with plenty of cellular and adipose tissue, have generally a lax and unresisting venous system. Such subjects, he claimed, are most frequently the victims of prostatic enlargement. He considered that sedentary habits favored the disease.

Amussat[8] stated that syphilis, a foreign body in the bladder, or stricture of the urethra were the most common causes of prostatic enlargement. It it observed, he claimed, chiefly in elderly persons who have for a long time used sounds or bougies upon themselves.

Desault[7] claimed that enlarged prostate was very common in elderly men, and in those who have had numerous attacks of gonorrhœa. He also believed that the disease might bear a causal relation to scrofula and other cachexiæ.

Civiale,[9] in discussing the etiology of prostatic hypertrophy, placed first in the order of prominence vesical calculus. Second only to vesical calculus, he considered organic strictures of the urethra. He denied the relation of venereal excesses to chronic prostatic disease.

Coulson[11] contents himself with the presentation of the views of others and has no opinion of his own.

Thompson expresses himself in the most unequivocal fashion as believing that prostatic hypertrophy is seen in young patients; the organ in such cases becoming enlarged by interstitial plastic effusion, the result of inflammatory action, while in old age there is unnatural development of the prostatic tissue proper, i. e., it is true hypertrophy. According to him, the action of inflammation and its products does not favor growth, but it is directly antagonistic to such a process. A prostate, therefore, which has been enlarged by inflammatory effusion is according to Thompson, probably less likely subsequently to exhibit an hypertrophic tendency. Nutrition is thus impeded, not encouraged. In brief, Thompson feels warranted in excluding inflammation from the list of causes. Urethral stricture and calculus are not considered by him to be of great importance in the etiology of prostatic hypertrophy. He does not believe that habitual engorgement of the prostatic and hemorrhoidal plexuses has much to do with the etiology of the disease. True hypertrophy, according to him, in any situation never has venous congestion for a cause; venous congestion impairs structure and predisposes to ulceration of the tissues affected by it, but it never augments vital force or stimulates growth. Upon this ground Thompson denies congestion as a possible cause of hypertrophy of the prostrate. He further disputes the possibility of rheumatism, gout or syphilis playing any part in the pathological process. Regarding the effect of sexual excesses, he says: "Much influence has been attributed to the effect of habitual indulgence of this kind; but from the fact that the affection has been observed to occur in individuals known to have been remarkable for chastity, the opposite extreme of continence has been regarded also as exercising a similar influence. In regard to the first, it appears reasonable to believe that repeated use might induce hypertrophy here as elsewhere; while, without entering upon the question of prostatic function, it is impossible not to asscciate the organ with the sexual act, and admitting this it appears not to be easy to escape the inference that hypertrophy is likely to result from sexual excess; yet facts do not favor this view. Hypertrophy does not exist when the function is in greatest vigor and is not called into immediate existence by the most licentious excesses indulged in during the prime of life, and in must be admitted that in any part of the body hypertrophy develops itself

coincident with, or, at all events, immediately follows the increased action which induces it."

Although Thompson disputes the view that the prostate is truly a secreting gland, he admits it for the sake of argument, and claims that no other gland offers a pathological parallelism with hypertrophy with the prostate; all of its component tissues are not increased in their relative proportions. An enlargement of the gland may be due to an increase of glandular elements; or, on the other hand, to a change in the structure and an increase in the bulk of the prostatic tissues proper. Thompson does not believe, furthermore, that an enlargement of the prostate is a simple muscular hypertrophy induced by increased action. He calls attention to the close similarity between the uterus and the prostate and seems to think that just as during the latter part of the period of reproductive activity the uterus is prone to develop new growths identical in structure with its own, a similary tendency will be found to develop new gowths in the prostate at a corresponding period in the life of the male. Thompson's tables apparently support the view which he promulgates by showing that hypertrophy of the prostate is a disease incidental to old age, but he fails to make clear the precise connection between advancing age and the development of prostatic hypertrophy. Even granting that old age is the chief factor in the production of the disease, there is yet much to be accounted for. Why should so large a proportion of elderly men present a condition so distinctively pathological affecting an organ which in old age at least should be practically of no importance from a physiological or functional standpoint? Thompson himself admits that hypertrophy of the prostate is not necessarily, or even usually, present in old age, but is rather an exceptional condition. According to him, a slight tendency to hypertrophy of the prostate undetermined during life may exist in about one in three individuals after 60 years, and that a marked enlargement may be met with in any one out of seven or eight after that age.

The modern French school, following that celebrated authority upon genito-urinary diseases, M. Guyon, entertains the peculiar view that enlargement of the prostate is not a local condition and the effect of local causes, believing that all the urinary organs, and particularly the bladder, undergo changes of analogous character, the origin of which should be looked for in structures bearing absolutely no anatomical relation to the urinary system; implying, in short, that enlargement of the prostate is dependent upon general atheroma. Thus this school claims that the walls of the bladder fail in their power with a resulting accumulation of residual urine followed by cystitis, *prior* to the enlargement of the prostate. Reginald Harrison has asserted that the habit of partial retention frequently precedes the vesical signs of prostatic enlargement, the depression of the posterior wall of the bladder being a primary change. The depression of the posterior wall of the bladder results in a compensatory hypertrophy which determines the development of a strong muscular band or buttress at the base of the trigone, and finally enlargement of the prostate itself.

It is obvious that even though we admit that in certain cases, depression of the floor of the bladder and alteration in the walls of that viscus precede perceptible pathological change in the prostate, I contend that such cases are no argument against what appears to me to be the correct view, that pouching of the bladder is generally a secondary condition. General atheroma, for example, with a resulting alteration of the structure and power of the bladder might occur and subsequently become associated with enlargement of the prostate, which enlargement is due to the same causes as in other cases in which prostatic hypertrophy is unassociated—primarily at least—with disease of the bladder.

Taking for our point of departure the modern and rational view that all pathology is but perverted physiology, it becomes our duty to inquire into the structure and function of the prostate in our endeavor to determine the chief factors in the production of that peculiar enlargement known as prostatic hypertrophy.

The older nomenclature of the prostate, which implied the glandular structure and function of the organ, has been assailed by modern authorities upon genito-urinary disease, and there has been considerable argument upon the question as to whether it functionates purely as a muscle or its muscular action is secondary, or better, auxiliary to its glandular function. The most interesting and logical description of the prostate extant, is found in the recently published lectures of Mansell Moullin[1]. This author begins a discussion of the subject with the assertion that "the prostate neither acts as a sphincter, nor as a muscular buttress.

"It does not assist in the propulsion of urine, nor does it delay its exit from the bladder. It is purely and simply a sexual structure developed around the first portion of the urethra in connection with the sexual organs and with a well-defined sexual function. The first portion of the urethra, which is surrounded by the prostate, belongs anatomically to the bladder, which is not only continuous with it, but is developed from the same structure, the allantois. They are absolutely distinct from the rest of the genito-urinary passages. In the monotremata the penile and prostatic portions of the urethra never become organically joined, the penile portion of the urethra serving as a sexual organ only and having nothing to do with the urinary function. In man a somewhat similar condition is seen in so-called hermaphrodism where the urethra opens in the perineum, and if a transverse section of the prostate be made just below the vesical neck in an infant, the relation of the prostate to the urethra cannot be mistaken. The urethra lies in the center or a little in front of the prostate, with a few longitudinal bundles of non-striated muscular fibre around it. External to these fibres there is a very thin layer of circular fibres, some of which appear to be muscular. This is probably part of the circular coat of the bladder. "The prostate itself forms two great masses, one on each side, composed almost entirely of ducts with an indication of acini at their ends, converging toward the central canal. In front, they are connected together by interlacing fibres with large nuclei spreading from the great transverse mass of stroma that stretches across the urethra. The prostate, in short, surrounds the urethra, supporting it, but forming no part of it. The canal runs down through the middle and the gland is simply grouped around it.

"The sexual character of the glandular part of the prostate is not to be seriously questioned; it can have nothing to do with micturition. The glands do not attain their full growth until the time of sexual maturity. In castrated animals they waste and disappear and, like the other sexual organs, in many animals, their size and perfection of structure rise and fall according to the breeding season. The stroma of the gland, the fibrous and muscular tissue surrounding the first part of the urethra, is held by many to be the real seat of hypertrophy in old age. Whatever may be its pathological conditions, the stroma of the gland is purely sexual and has nothing to do with micturition as long as the structure is normal at least. That it is unnecessary to the urinary function, is shown by the fact that women and children get along very well without it." As Moullin very properly states, this description of the structure and function of the prostate holds good only so long as the organ is in a normal condition. Any alteration in shape, size or consistence distinctly modifies its relation to both the urinary and sexual functions.

From what has been said it should, it seems to me, be plain that the prostate is practically a gland, the function of which is of a purely sexual character. The glandular elements are held together by a certain amount of connective tissue stroma, reinforced and protected by an amount of muscular and fibrous tissue, varying according to the degree with which the gland departs from its normal condition. Either inhibition or exaggeration of function is likely to result in a change in the stroma of the gland.

It must be admitted that in seeking for the etiological factors of the peculiar pathological changes to which the prostate is subject, we must take the structure and function of the normal prostate as our point of departure. It is imperatively necessary in the consideration of those

pathological processes of a chronic character in which there is no traumatic or infectious element to explain their etiology. If the function is a sexual one, it is here that we must look for the cause. If the function of the prostate body be essentially that of a gland, it is to its function as a gland that we must refer in explaining its pathology. If the function of the prostate is that of a muscle, we must consider perturbations of its muscular action in studying the etiology of prostatic enlargement.

I have never been able to understand by what process of reasoning enlargement of the prostate has been attributed to the age of the patient *per se;* particularly does this theory seem far-fetched if we consider the prostate as a sexual gland, the activity of which should decrease with advancing age, with a resulting atrophy—if indeed any change at all should occur—rather than an hypertrophy. As Moullin shows, both by logical argument and by actual demonstration, "the enlargement of the prostate is, at its commencement at least, essentially a diffuse glandular growth, spreading chiefly in the mucous and submucous tissues and later becoming considerably modified by secondary changes; failure in expulsive power of the bladder being in almost every instance the direct consequence of it. Age alone, though it may not be without influence, certainly cannot be the cause for two reasons, either of which is sufficient. In the first place, prostatic overgrowth is not met with in anything like the majority of old men, and its degree bears no relation to the age they reach; and, in the second place, it may occur, and does so with very much greater frequency than is usually believed, in those who certainly do not deserve to be called old, whether the number of years or the condition of sexual power is taken as the standard. The time of life at which it makes its first appearance must not be confounded with the age at which the presence of residual urine is ascertained. The growth may have been present for years before giving rise to this particular result, and the absence of any enlargement when the gland is explored only per rectum is not of the slightest value as regards its extension in other directions. If vertical antero-posterior sections are made through the neck of the bladder and the urethra after hardening the part with as little disturbance as possible—and this is the only fair test for the vesical form of overgrowth for rectal measurements, the weight of the gland when dissected out, or the external dimensions, however carefully they are taken, give very little information as to the shape of the gland, and none at all regarding its consistence, it is by no means uncommon to find a considerable degree of increase in the size of the prostate long before what can be called old age, whatever the standard." Moullin then proceeds to give a number of cases ranging from twenty-seven to fifty-four years of age. The point raised by Moullin regarding the frequent occurrence of enlarged prostate at an early period of life is interesting, for it has been my experience that a large proportion of comparatively young individuals whom I have examined for various genito-urinary affections, not necessarily connected with the prostate, and who have not recently suffered from acute inflammation of the organ, present a distinct fulness of the prostate when examined per rectum. I have found this condition in masturbators and in individuals who had had at a remote period inflammatory trouble in and about the prostate and neck of the bladder. I find it very often where there are no symptoms distinctly referable to the prostate itself, and it seems to me highly improbable that all of these cases can go through life without annoyance incidental to increasing prostatic hypertrophy,—or hyperplasia, if you please,—with subsequent condensation of tissue. It has seemed to me that the relation of old age to hypertrophy of the prostate is a secondary one, the primal point of departure being really pathological conditions incidental to an abuse of the sexual function, or to acute or subacute, inflammatory or congestive processes of the organ during early life. To put the matter more succinctly: I believe that old age bears the same relation to enlarged prostate that it does to certain joint troubles that come on late in life, as a consequence of some long forgotten pathological condition or injury occurring

at an earlier period of life, and that in view of the distinctly sexual function of the prostate, an exaggeration of the secretory activity of the gland and the muscular action incidental to expulsion of semen during the earlier years of life, causes the injury which in most cases constitutes the point of departure for prostatic hypertrophy later on. An additional factor is the occurrence of gonorrhœal inflammation. While as yet my experience has not extended over the requisite number of years to enable me to present cases that have been watched for a sufficient length of time to establish this point positively, I have cases of middle aged men under my observation at the present time, whom I have seen off and on for the last ten years, who are suffering from prostatic disturbance and enlargement of greater or less degree, which has been more or less continuous during the time that they have been under my observation, and which were undoubtedly due originally to sexual excesses, gonorrhœal inflammation, or both, in combination in some instances with dietetic and alcoholic excesses.

I have under my care at the present time a physician of forty-five years of age, who has a prostate which is distinctly enlarged, a moderate amount of residual urine, and a considerable degree of cystic disturbance whose own observations and opinions of his case confirm the assertion that I have just made.

I have another case under observation of a layman, fifty years of age, who confesses to sexual excesses, and states that he has had trouble with the bladder and prostate more or less continuously since an attack of gonorrhœa, with resulting prostatitis at the age of thirty. While this case is open to impeachment on the ground of too short a period of observation on my part, at the same time the history is worth something and the fact remains that there is prostatic enlargement. I will not attempt to present a long array of cases, which appear to me to support my view of the etiology of enlargement of the prostate, but I am confident that I could present a sufficient number of cases to make quite a comprehensive paper by themselves.

I am inclined to believe that the term prostatic overstrain is sufficiently comprehensive to embrace the etiology of a very large proportion of cases of enlargement of the prostate. Just as the tissues of a joint, which has experienced a strain during early life, may become thickened as senility approaches without there being necessarily any manifestations of pathological change elsewhere, so may the much abused prostate suffer in old age, the penalty for the abuse it receives during the youth of the individual. But it may be argued that enlargement of the prostate occurs in men who have led chaste lives, and in those who have never had a gonorrhœa, or indulged in the pleasures of the table to excess. It may occur, for example, in the honest farmer, who has been surrounded all his life by an environment conducive to the perpetuation of the ideal physical condition. But there are other evils to be taken into consideration besides sexual excess—infection and the liquor habit. While not so likely to become a masturbator as is the city boy, the young lad in the country very often does fall into this habit, and he is much more likely to suffer from ungratified sexual excitement than is the young man in city life. Strict continence should imply not only physical continence from a strictly sexual standpoint, but mental continence and an abstinence from masturbation. If it be granted that masturbation will produce hyperæmia and hyperæsthesia of the prostate and the prostatic urethra; and if, moreover, it be admitted that the function of any glandular or muscular organ cannot be long abused without the production of a permanent morbid impression, the probable importance of masturbation as an etiological factor in enlargement of the prostate must be admitted. If this be admitted, and the large proportion of boys who are addicted to this habit be taken into consideration, the question of masturbation as an etiological factor in hypertrophy of the prostate becomes a very important one.

Can disturbance of micturition *per se* produce conditions which may lead later in life to enlargement of the prostate? I believe that they can, but the manner in which this is brought about is almost pre-

cisely the same as in the case of prostatic overstrain from sexual excess. Irritation of the prostatic sinus and membranous urethra, *i. e.*, the neck of the bladder, produces frequent and spasmodic expulsion of urine with an attendant stimulation of the nerves of sexual sensibility and a resulting disturbance of the circulation of the prostate similar to that which prevails during sexual excitement and ejaculation. The relation of this condition of affairs to prostatic congestion is well shown by the almost magical effect of the posterior urethral application of nitrate of silver in such cases. The nitrate of silver applied in this manner has certainly no effect upon the prostate *per se*. It is a question indeed whether fluids thus applied ever enter any of the various ducts of the prostatic glands. The nitrate of silver probably superficially cauterizes, or, if you please, constringes only the mouths of these orifics, any other beneficial effect being explained by its action upon the mucous membrane lining the prostatic sinus, and its germ-destroying properties. The fact remains, however, that a large tumefied prostate incidental to the habit of masturbation, or following infection of the deep urethra, will often subside very quickly under the influence of a succession of applications of nitrate of silver to the prostatic sinus.

If the causes of prostatic overstrain be continued during middle life, as they are very apt to be, it is not to be wondered at that there is danger of prostatic hypertrophy. As long as the tissues of the body are elastic and well nourished—tissue metamorphosis occurring readily and rapidly—the various organs and tissues of the body soon recuperate themselves and return to their normal condition after they have been the subject of frequent and extraordinary strain. As the individual approaches middle life, however, this fortunate provision of nature no longer prevails, and in the case of the prostate the penalty of overstrain is obvious. As the prostate enlarges its increase of bulk enhances the very conditions which produced it. The sexual furor and obstinate priapism observed in some old men with enlarged prostates, are familiar to every experienced surgeon.

The influence of gout and rheumatism in the etiology of prostatic hypertrophy must, I think, be taken into consideration, although not to the extent claimed by most of the authors who accept these diathetic conditions as possible or probable causes of prostatic hypertrophy. In considering these diathetic states in their relation to prostatic enlargements, it is fair, I think, to again refer to prostatic overstrain as of the primary condition. To use what is perhaps an indefinite term, but is none the less comprehensive, it may be said that the tendency to chronic formative irritation—or rather to chronic pathological tissue building—seen in many gouty and rheumatic subjects, particularly late in life, may manifest itself only in some organ or tissue which many years before perhaps has been the subject of injury or overstrain. Taking again as our point of departure the thickened and stiffened joint developing in the old man who has suffered an injury to that structure many years before, the possible importance of gout and rheumatism is at once obvious. Few practitioners indeed have not met with cases of so-called rheumatic gout or arthritis deformans limited to a joint or joints which the history plainly shows to have been injured more or less severely in early life.

In regard to the influence of diathesis in the production of hypertrophy of the prostate, I will therefore simply assert my belief that gout and rheumatism should occupy a minor position in the etiology of the disease, because such constitutional states promote tissue irritability and a tendency to new growth at points of strain and irritation either present or long since forgotten.

Prostatic enlargement, as I have shown in the *résumé* of opinions upon its etiology, has been referred to stricture. Stricture of the urethra I believe to be capable of producing chronic congestion and hyperplasia of the prostate, i. e., overstrain with resulting circulatory disturbance, if you please. But I would advance the proposition that within certain limits the danger of prostatic hypertrophy resulting is inversely to the degree of obstruction. By this I mean to convey the idea that strictures of large calibre in the penile

portion of the canal produce proportionately a much greater reflex disturbance of the prostate than deeper strictures of small calibre in the deep urethra. I think that a man who at the age of from 30 to 40 presents himself with a very tight stricture in the deep urethra is likely to be perfectly protected from enlarged prostate in after life; or if the prostate itself becomes enlarged the enlargement is not likely to encroach upon the urethral calibre at the neck of the bladder or to jut into the vesical neck. While irritation and congestion occur, hyperplasia of the portion of the prostate which is most likely to produce urinary obstruction is prevented by the pressure of the urine in the prostatic urethra. My experience in the performance of perineal section upon tight strictures in the musculo-membranous region, has been that the prostatic urethra is often extremely dilated at the expense apparently of the prostate itself, or at least that portion immediately contiguous to the mucous membrane lining the prostatic sinus. The effects of pressure in producing relative prostatic atrophy are well shown in cases of calculi which become lodged in the prostatic urethra. There may be, it is true, compensatory hypertrophy of the outlying fibres of the prostate, but we must not forget what seems to me to be a very logical analogy, viz.: the hypertrophy of the heart followed by extreme dilatation which results from obstructive valvular lesions.

It must be admitted that whatever the cause of pathological tissue building, hyperplasia or hypertrophy of tissue, the tissue thus formed is produced for a purpose—not always beneficial it is true—for certain anatomical or physiological conditions frequently defeat nature's object in this direction as seen in the case of stricture of the urethra, but even in case of stricture of the urethra nature's intentions are good, and the neoplastic formation is placed there for the purpose of promoting rest or relieving strain. It is either a splint or a bulwark against pressure. If it be admitted—and I think it will be—that nature does nothing in an haphazard way, the proliferation of glandular, connective and muscular tissue incidental to hypertrophy of the prostrate is readily understood. If there were no special causes of strain the prostrate, if it change at all in old age, should atrophy *pari passu* with the diminution of sexual activity, as it does in castrated animals and eunuchs. That it does not frequently atrophy is explicable by two facts, to wit: 1. That very few individuals are in a perfect physiological condition from a sexual standpoint during their entire lives. Fewer still enjoy a normal old age. 2. The sexual activity is long enduring in the male, and the sexual organs may remain capable of the physiological performance of their functions until a period when in other directions the individual is in a condition of advanced senility. To put the latter proposition a little more plainly, and with no intention to be facetious, it may be remarked that the individual dies before his sexual organs have time to do so, in the large proportion of cases. This prolongation of sexual activity is acquired by the human race through faulty sexual hygiene. It is an acquired disturbance of physiological equilibrium.

Prostatic overgrowth from hyper-functional activity of the organ—this being the most comprehensive term which can be used in describing its etiology in detail—may affect the prostrate in several different ways. There may be an excess of glandular tissue, which Moullin believes to be of paramount importance, or there may an access of fibroid tissue. The resulting enlargement may be diffused and general, or may be circumscribed. The arrangement of the enlargement depends largely upon certain secondary conditions to which the hypertrophy may lead, and anatomically upon the relative proportions of fibroid, muscular, connective and glandular tissue. Much depends upon the age at which the subject is examined. If a large number of prostrates in comparatively young subjects in whom more or less congestion and enlargement of the prostrate is present—which is not usually considered to be a preliminary stage in the development of prostatic hypertrophy, but which I believe to be so—could be examined post mortem the proportion of glandular tissue would, I think, be found to be much greater than

in more advanced cases. The glandular elements may be strangled out by fibro-connective tissue development—as in cirrhosis of the liver—as the case progresses. It is this metamorphosis that explains why the engorgements and hyperplasias of the gland occurring in early life have been supposed to be distinctly different from, and to bear no relation to, the pathological condition of the organ occurring in old age.

One of the strong arguments in favor of disturbance of micturition being a direct cause of prostatic hypertrophy, is that the patient presents a history of urinary irritation and obstruction of a greater or less degree of severity, extending perhaps over a number of years before he consults a surgeon; in other words, the secondary results and the most important symptom of prostatic hypertrophy have existed for a long time before the enlargement is discovered by exploration.

We must take into consideration in this connection some very important facts, viz.: 1. Prostatic hypertrophy is not likely to give rise to symptoms until a certain amount of residual urine has collected as a consequence of the obstruction. 2. A considerable degree of residual urine may be tolerated without great discomfort until such time as decomposition occurs. Decomposition is not very likely to occur unless exploration or instrumentation has been undertaken. The cystitis of the prostatique is an ingraft upon the prostatic enlargement and the resulting depression in the *bas fond*, due, as a rule, to catheterization with a dirty instrument. As long as the residual urine does not decompose, just so long does it give rise to very little discomfort. Sometimes the discomfort experienced is very slight, although the amount of residual urine is large in amount, until acute engorgement with resulting sudden urinary obstruction occurs and call attention in a very urgent manner to the condition of the hypertrophied organ. 3. A considerable degree of obstruction with resulting accumulation of residual urine may occur in cases of posterior median hypertrophy or the formation of a bar at the neck of the bladder, which is not easily discoverable by examination either instrumental or digital. This condition produces, in many instances, very disagreeable symptoms and if, after a time, enlargement of the prostate be sufficiently advanced to enable the surgeon to detect it readily, it is likely to be attributed to the long-standing trouble of micturition. A confusion of *propter* and *post* under such circumstances is not to be wondered at.

Regarding the influence of syphilis in the production of prostatic hypertrophy I will simply state that I do not believe that it is of the slightest etiological importance.

I cannot leave the subject of prostatic hypertrophy without paying some attention to certain forms of prostatic disease which will at once suggest themselves to the thoughtful surgeon, as apparently contradictory to some phases of the etiology of the affection as evolved in the foregoing remarks. I refer to those cases in which there are distinct fibro-myomatous or glandular tumors which may be shelled out of the organ upon division of the investing tissues. It has been shown that such tumors are sometimes merely covered in by the prostatic capsule, while in other instances they are imbedded to a greater or less depth in the prostatic tissue. I believe, notwithstanding the apparently distinctly tumorous character of such growths, that the etiological factors which I have outlined may bear an important causal relation to them. I confess, however, that it is much more difficult to define the relation of cause and effect in such cases than in those in which there is a distinct general glandular or fibro-muscular enlargement of the organ. To explain the occurrence of these growths perfectly satisfactorily, it will be necessary to give, at the same time, a logical explanation of uterine fibro-myomata, which offer the clearest analogy to the growths under consideration, as well as of fibroid growths in other situations. The old time explanation of analogy based upon the supposed homology of the uterus and prostate explains nothing, particularly in view of the fact that the etiological theories of uterine fibro-myomata thus far advanced, are by no means as clear as could be desired. Possibly the theory of neoplasms

formulated by Cohnheim is about as comprehensive and logical as anything which has thus far been brought before the profession. Idiosyncracy in the form of a local histological aberration is certainly worthy of consideration. Even admitting the existence of such a local idiosyncracy, however, it might still remain for the etiological factors which I have outlined to determine the occurrence of the growths. When once a circumscribed growth begins, certain local conditions may tend to enhance its circumscription, as is seen in the pedunculation of the so-called median lobe, in which the increasing frequency of micturition unquestionably has some effect in modifying the form of the enlargement.

CONCLUSIONS.

1. The principal criticism which I would offer upon the hitherto published theories of the etiology of prostatic hypertrophy is that there has been an arbitrary attempt by most authors to assign the disease to one particular cause or co-related set of causes to the exclusion of other influences, and with an apparent disregard for the physiology of the organ. This is especially true of the theories of senility, general atheroma, and diathetic conditions.

2. The prostate, while it partakes of some of the pecularities of an involuntary muscular structure is, after all, anatomically and functionally a gland of a peculiarly sexual character.

3. The relation of the prostate to the function of micturition is purely an accidental one, as shown by the perfect performance of this function prior to the period of development of the prostate, and in Eunuchs and Geldings in whom it is atrophied. The participation of the prostate in the urinary function is not only secondary, but where it does come prominently into play, is a sequence of pathological conditions.

4. Granted the sexual and glandular function of the prostate, it is in the direction of the perturbation of this sexual and glandular function that we must look for an explanation of hypertrophy of the organ, or, in short, for all pathological disturbances which are not the direct result either of traumatism or infection.

5. Hypertrophy of the prostate is in all probability due to overstrain of the organ during the period of its greatest sexual activity. This overstrain produces active congestion or hyperœmia, and glandular proliferation, which, if it persists for a long time, is not followed by restoration to the normal condition, but by permanent hypertrophy. Prolonged and ungratified sexual excitement with its resultant disturbance of the circulation of the prostate may, equally with sexual excess, produce a disturbance of the nutrition of the gland which late in life will result in prostatic hypertrophy.

6. The conditions which constitute the point of departure from the normal prostate that determines prostatic hypertrophy at a later period, comes on earlier in life than is usually supposed, a large number of individuals being affected by it.

7. In the majority of instances prostatic hypertrophy is attributed to senile change, simply because the secondary results of a prostatic enlargement occurring at a relatively early period, do not manifest themselves in most instances until the patient is well along in years. It is conceivable that, although more or less prostatic obstruction may exist before middle age, residual urine may not accumulate in any great quantity until after the bladder walls themselves have begun to loose their elasticity by virtue of the physiological changes incidental to increasing age. Even admitting that residual urine has formed in considerable amount, there may be very little resulting disturbance until such time as germs penetrate the bladder and set up decomposition.

8. The occurrence of prostatic hypertrophy in advanced life as a consequence of overstrain of the organ at an earlier period, is explicable upon the same grounds as is the development of arthritic disturbance at the sight of a traumatism—i. e., a strain received in early life—in persons beyond middle age.

9. Senility, gout, rheumatism and general atheroma are in all probability not the exciting causes of prostatic hypertrophy, but are determining factors in so

far as they promote irritability of tissue, a tendency to connective tissue proliferation and a loss of elasticity of tissue.

10. Prostatic hypertrophy is really an evidence of conservatism on the part of nature in her attempts to resist strain and promote rest of a much abused organ, and begins at the time when such abuse is most pronounced, although its effects may not be manifested until later in life when other influences have had time to come into play. While the prostate is not normally a urinary organ strictly speaking, and while disturbance of micturition is not *per se* causative of prostatic hypertrophy, said disturbance when once it arises as a consequence of prostatic hypertrophy, necessarily reacts upon the diseased organ and enhances the pathological condition present.

12. In a perfectly normal old age, it is probable that the prostate should atrophy. That it does not do so more frequently is explained by the prolonged duration of the sexual function in the human species incidental to the developmental effect of over indulgence and other causes of sexual over-stimulation.

It may be remarked in passing that neither the human male nor female is on the average in a perfectly healthy state from a sexual standpont, inasmuch as the sexual function is made subservient to sensual gratification rather than the procreative act its original object. The sexual life of the lower animal—at least in the wild state—typifies the normal in most instances, while that of the human subject typifies the abnormal, or, if you please, the artificial. There is no question in the minds of logical gynecologists and neurologists as to the truth of this assertion regarding the female, and I feel free to maintain that it bears with equal force upon the sexual function and organs of the male. That an organ is patient and long-suffering under physiological abuse, does not obtain for the individual who abuses it, immunity from future penalties.

13. It will be found by careful rectal examinations of men from the age of twenty upwards, that a prostate which is perfectly normal in size, consistency and sensibility is the exception rather than the rule. This is true of the masturbator and sexual hypochondriac as well as of the individual who has had posterior urethritis, although the latter condition is, it must be confessed, a very frequent explanation. That this aberration of the prostate is followed in the majority of cases, by a return to a perfectly normal condition is highly improbable in the face of the fact that the majority of patients so affected lead lives, which are so unphysiological from a sexual and dietary standpoint, that the condition of the prostate is more likely to become aggravated than improved. To expect complete resolution in the average patient, who keeps up his sexual abuse and perhaps over-indulges in the pleasures of the table, would be absurd. The penalty in such cases is, very frequently, in my opinion, hypertrophy of the prostate.

14. There are certain cases of so-called prostatic hypertrophy of a circumscribed character, which should properly be termed fibro-myomata of the prostate, and in which the etiology is very obscure. The old time homology with the uterus explains nothing in the face of the obsurity of origin of uterine fibro-myomata. Even in this last variety of prostatic tumors, the etiology outlined in the paper and conclusions, may have a practical bearing.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.
Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Excellent Teaching Facilities, Capacious Hospital, Large Clinics.

Send for catalogue, and address

DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel.)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

LEHN & FINK,

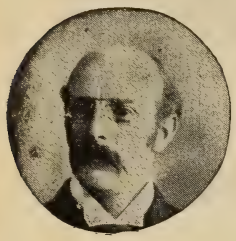
ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

MEDICINAL PYROZONE.



Dr Franks.

THIS name is applied to a preparation of peroxide of hydrogen containing three per cent. of $H_2 O_2$ combined in such a way as to render the solution stable, and, with very ordinary precautions, the last portions of a bottle will be of fully the same strength as the first. This quality, which is unusual in solutions of peroxide of hydrogen, is due to the care exercised in the manufacture of the Medicinal Pyrozone, and is of great importance, as a preparation which is growing weaker daily, is not only a great inconvenience, but a positive danger. The Medicinal Pyrozone, when not in use, should be kept from contact with organic matter.

Peroxide of hydrogen was discovered and described in the year 1818 by the illustrious French chemist, Baron THENARD. B. W. RICHARDSON, M. D., (*Asclepiad*) says: "In 1860 I made my first report to the Medical Society of London, and, in 1862, I made a second report on the medicinal use of the peroxide. I had by this time used it in two hundred and twenty-three cases of disease, including phthisis, diabetes, anæmia, sub-acute and chronic rheumatism, strumous enlargement of the cervical glands, mesenteric disease, pertussis, chronic bronchitis, chronic laryngitis, mitral disease, and dyspepsia. In epitome of results I drew the conclusions: That in diabetes the peroxide reduced the specific gravity of the urine, while it rather increased the quantity: that in chronic and sub-acute rheumatism is afforded relief; that in valvular disease of the heart with pulmonary congestion it gave relief to the dyspnœa; that in mesenteric disease; and in jaundice it caused an improvement in the digestion; that in pertussis its effect for good was very remarkable, since it cut short the paroxysms of cough, and seemed decidedly to shorten the period of the disease; that in chronic bronchitis it lessened the dyspnœa, and rendered the expectorated matter less tenacious; that in chronic laryngitis it gave pain on being swallowed, and did not appear to be useful; that in anæmia it did not of itself render any service but favored the good effect of iron; that in the first stage of phthisis it caused improvement in the digestion, and in the later stages gave unquestionable and even wonderful relief to the breathlessness and oppression, acting, in fact, like an opiate without narcotism, and assisting oxidation.

In the discussion which followed upon the reading of this paper I was warmly supported in several points by Drs. GIBBON, SYMES, THOMPSON, and GIBB, all of whom had been prescribing the peroxide on the suggestion made in my previous paper of 1860. Dr. GIBB bore special testimony to its value in affording relief during the last stage of phthisis, for which I had recommended it in the case of a member of his own family. But the most important new observation I had to communicate to the Society in 1862 was that in free and frequently repeated doses the peroxide could be made to produce a modified salivation. a fact which led to two suggestions: firstly, that in the use of mercurial and iodide preparations it was the chlorine or iodine in them which caused the ptyalism; secondly, that the peroxide would be a good substitute for mercury and the iodides in the treatment of syphilis.

In testing the action of the peroxide on natural organic structures which liberate oxygen from it, I observed, as related above, that the fluid oxygen causes, in some instances, decomposition of the organic matter. The same factwas observed with abnormal organic material like pus. When pus is placed for observation under the microscope, mixed with the neutral peroxide solution, the phenomena are most interesting. The pus corpuscles are, for a time, driven about as if they were alive. They move in all directions, assume ovoid shapes as they squeeze through masses that may obstruct their course, and after many variations of form and movement come to a standstill, like amorphous matter, dead, so to speak, and entirely disorganized. This effect of the peroxide in destroying pus cells led me very early in these researches to use the solution for the treatment of suppurating surfaces, and with great success."

Many other observers have testified to the value of this remarkable substance, not only as a disinfectant in the treatment of wounds, etc., but as a curative agent in a great number of infectious diseases,

---

DR. THOMAS S. K. MORTON, in an article on the "Treatment of Leg Ulcers." N. Y. *Med Journal*, page 26, July 2, 1892, says: "Next, the ulcerated surfaces are subjected to the powerful but harmless antiseptic action of a spray of full strength (15 volume) peroxide of hydrogen solution. Pouring on of the agent is almost as efficient, but very wasteful. If the spray is employed, however, it is essential to use an atomizer of which every part is made of hard rubber, as the powerful oxidizing qualities of the solution will almost immediately destroy any metallic parts with which it may come in contact. The ulcer, having been thus sprayed until active effervescence ceases, is then gently washed off by a stream of simple water, or by a pledget or mop of absorbent cotton saturated with the same. This carries away all detritus loosened up by the action of the peroxide."

McKESSON & ROBBINS, AGENTS,
NEW YORK.

Pure peroxide of hydrogen is a liquid of a higher specific gravity than that of water; consequently, the common term "15 volume solution" is very misleading; and, as a fact, we find that analyses of these solutions show that, instead of the three per cent. of the peroxide which they should contain, they seldom show more than two per cent.; and very frequently but one and one-half per cent., or but one-half of the proper quantity.

Medicinal Pyrozone always contains three per cent. of the pure peroxide of hydrogen by weight, and can be relied upon in all cases as being of this strength.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,
WASHINGTON, D. C.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac. Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up." This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R. WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Gingerine . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ⅛ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indigestion, and will afford permanent benefit in cases of enfeebled digestion, where the gastric juices are not properly secreted. As a dinner pill, Pil. Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . 1 gr. | Concentrated Pepsin 1 gr.
Ext. Nux Vomica ⅛ gr. | Dose—1 to 3 pills.

Pil. Antiseptic Comp. is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

7 Reasons why Papoid is Superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments." (KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers." (WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

DR. WM. A. HAMMOND'S
PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cable cars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1;"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention **"*COLDEN'S*,"** viz., *"Ext. Carnis Fl. Comp. (Colden)."* A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. ***Sold by druggists generally.***

The Latest Medical Works, almost without exception, endorse

LONDONDERRY

AS THE

STANDARD LITHIA WATER.

The following is the very latest:

From Materia Medica Pharmacy, Pharmacology, and Therapeutics, by W. Hale White, M. D., F. R. C. P., Physician to and Lecturer on Materia Medica and Therapeutics at Guy's Hospital, London; Examiner in Materia Medica to the Conjoint Board of England; Author of a Text-Book of General Therapeutics. Edited by Reynold W. Wilcox, M. A., M. D., LL. D., Prof. of Clinical Medicine at the New York Post Graduate Medical School and Hospital; Assistant Visiting Physician to Bellevue Hospital; Fellow of the American and of the New York Academy of Medicine, etc.:

"Lithium salts closely resemble in their action the corresponding potassium salts, but as very little lithium is sufficient to form a salt with uric acid, and urate of lithium is very soluble, they *are more powerful solvents of uric acid.* They are also more efficacious as diuretics and render the urine very alkaline. Large *doses* are *general depressants* like potassium salts. Salts of lithium are much used internally in acute and chronic gout, to promote the elimination of urate of sodium. They are also given as solvents to patients suffering from uric acid, gravel and calculus. Those suffering from gravel often derive great benefit. *Lithium salts should always be freely diluted.* The LONDONDERRY LITHIA SPRING WATER is *especially useful* from its *richness* in *lithium,* which it contains in the form of the bi-carbonate."

NOTE.—*No other Lithia Water* is even mentioned by these celebrated authors.

Clinical Note:

We have just received a report from a man in Boston who has passed more than 150 large renal calculi, as the result of drinking **LONDONDERRY.** This, with other similar cases, together with some remarkable rheumatic cures, will be published in pamphlet form, and mailed to the physicians direct, as the patients are still living and object to seeing their names in medical journals.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp, C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE C. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

BOSTON.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to

Sup't Walnut Lodge, Hartford, Conn.

Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

CHLORALAMID (Schering).

HYPNOTIC.—Dose, 15 to 45 Grains. A full descriptive pamphlet (64 pages) supplied on request.

PIPERAZIN (Schering).

URIC ACID SOLVENT. Will dissolve at least twelve times more uric acid than lithia. Dose, 15 Grains per day, with continuous treatment. Pamphlet (32 pages) sent on request.

PHENOCOLL (Schering).

ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE. "The superior of all coal-tar antipyretics previously introduced." Dose, 7½ to 15 grains. Descriptive pamphlet (40 pages) supplied on request.

THIOL (Riedel).)

A synthetically produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical reports sent on request.

LYSOL.

"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

Our motto "DEFINITE CHEMICAL PRODUCTS" has proved a happy hit, and it bids fair to become at once a catch phrase and the standard by which new remedies will be gauged.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.

DR. WM. A. HAMMOND'S
PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cablecars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

HOSPITAL, 14TH ST. AND SHERIDAN AVE., WASHINGTON, D.C.

"CURIOUS QUESTIONS."

An Encyclopaedia of the Rare and Curious.

Third Improved Edition Now Ready.

"Curious Questions" fills a niche wholly its own. Its mission is to tell you hundreds of things that you ought to know, and don't; to enlarge your conversational powers; to brighten your intellect, and lead you to further research in the best channels of thought, and to keep you from exposing your ignorance on many questions of daily recurrence.

Do not think you are too wise to profit by it, when Rev. Dr. Andrew Preston Peabody, of Harvard University, says of "Curious Questions:"

> **"I find that some of the questions are such as I could not have answered, or have known where to look for their answers. Such a book will be of inestimable service and value to any intelligent person, young or old."**

The new de luxe editions (25 full-page illustrations) are unexcelled for presentations. Prices, $4.00, $6.00 and $8.00 a set.

Sold by subscription through our regularly authorized solicitors, or supplied direct by the publishers. Illustrated descriptive catalogue and sample pages free. *Agents wanted.* Address the sole publishers,

PRESCRIPTION CASE

is the most complete and handiest case in the market.

JOHN J. WOOD

1345 ARCH STREET PHILADELPHIA, PA.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

THE PENFIELD MF'G. CO. 1026 ARCH ST., PHILADELPHIA.

THE SOLUTION.

It is frequently impracticable for those who are away from home to follow the oft-given advice to boil the ordinary drinking water.

The **N. Y. Medical Journal** advises the use of a pure Table Water, such as Apollinaris, which can be had everywhere.

The **Sanitary Record,** LONDON, says that Apollinaris is absolutely pure.

The **Medical Record,** NEW YORK: "Exceptionally favored; pure and agreeable."

To quote **Professor Liebreich,** BERLIN: "Apollinaris Natural Mineral Water issues from a spring deeply imbedded in a rock, and is therefore of absolute organic purity."

For Pamphlets,

ADDRESS CHARLES GRAEF & CO., 32 BEAVER STREET, NEW YORK.

A NEW METHOD OF POSOLOGY

DIURNULES AND DIURNAL TABLET TRITURATES.

M. EDOUARD TROUETTE recently presented to the Paris Academy of Medicine a new method of administering Toxic Drugs that is very practical and seems destined to succeed the older ones.

This new method consists of the division of the maximum internal dose that can be given to an adult in twenty-four hours, in twelve Diurnules or Diurnal Tablet Triturates.

In anticipation of the popularity of this method we have prepared Diurnules and Diurnal Tablet Triturates of many toxic medicaments, a list of which will be sent on application.

The Diurnules are put up in bottles of 100 and 500, and the Diurnal Tablet Triturates in bottles of 100, 500, and 1000. In addition to these a leather pocket case of the Diurnules, containing ten vials, will be furnished for the convenience of physicians.

The Tablet Triturates are so made by stamping them by cross lines that division is readily possible into two or four parts. They may be powdered or dissolved in water.

With this method accidental poisoning need no longer be feared. Toxic medicaments may be given in efficient doses to adults and children without the least risk.

Full information concerning this method, with reprints of Dr. Trouette's article, furnished physicians on request.

PARKE, DAVIS & COMPANY,

DETROIT, NEW YORK, AND KANSAS CITY.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

GYNÆCOLOGY—B. F. Baer, J. M. Baldy, H. A. Slocum, C. P. Noble.

MEDICINE—Thomas J. Mays, S. Solis-Cohen, J. P. Crozer Griffith.

DISEASES OF THE MIND AND NERVOUS SYSTEM—S. Weir Mitchell, Charles K. Mills.

OBSTETRICS AND DISEASES OF CHILDREN—E. P. Davis, J. Madison Taylor.

GENITO-URINARY AND VENEREAL DISEASES—J. Henry C. Simes, Thomas R. Nelson.

DISEASES OF THE EAR—B. Alex. Randall, R. W. Seiss.

DISEASES OF THE SKIN—Arthur Van Harlingen, J. Abbott Cantrell.

DISEASES OF THE EYE—Edward Jackson, S. D. Risley, Geo. E. de Schweinitz.

DISEASES OF THE THROAT AND NOSE—Alex. W. McCoy, A. W. Watson.

CLINICAL CHEMISTRY AND HYGIENE—Henry Leffmann.

PATHOLOGY, CLINICAL MICROSCOPY AND BACTERIOLOGY—W. M. Late Coplin.

For announcement, address Secretary,

ARTHUR W. WATSON, M. D.,

Polyclinic, Lombard Street, above Eighteenth.

MEDICAL DEPARTMENT OF THE COLUMBIAN UNIVERSITY.

WASHINGTON, D. C.

ANNOUNCEMENT, 1892—'93.

The Seventy-first Session will begin October 1st, 1892, and continue seven months. Graded three year course required. Ample clinical facilities.

FACULTY:

J. F. THOMPSON, Surgery.
W. W. JOHNSTON, Practice.
A. F. A. KING, Obstetrics.
E. T. FRISTOE, Chemistry.
WM. LEE, Physiology.
D. W. PRENTISS, Therapeutics.
D. K. SHUTE, Anatomy.
H. C. YARROW, Dermatology.
G. B. HARRISON, Pediatrics.

THEO. SMITH, Bacteriology.
T. E. McARDLE, Minor Surgery.
H. L. E. JOHNSON, Gynæcology.
G. N. ACKER, Pathological Histology.
W. M. GRAY, Normal Histology.
W. K. BUTLER, Ophthalmology.
S. RUFFIN, Medical Jurisprudence.
C. W. RICHARDSON, Laryngology and Otology.
A. C. PATTERSON, Mental Diseases, Hygiene.

For circulars, address **A. F. A. KING, M.D., Dean,**

1315 Massachusetts Avenue, N. W., Washington, D. C.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.

THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.

The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M. D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M. D., LL. D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

Excellent Teaching Facilities, Capacious Hospital, Large Clinics.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed

T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

The Treatment for Consumption

which has received the greatest measure of approval from the medical profession is that known as

"Sommerbrodt's Creasote Treatment for Tuberculosis"

PROF. DR. JULIUS SOMMERBRODT'S latest reports on the use of C. P. Creasote for the cure of tuberculosis (*Berliner Klinische Wochenschrift*, No. 43, Oct., 1891), giving the results and conclusions of an experience in many thousands of cases extending over twelve years, has aroused new interest in, and induced the general adoption of his method of treatment. He uses and recommends the capsules herein contained, and disapproves of administering creasote in any different form, particularly objecting to the combination with balsam of tolu, and the pill form. The remedy should never be taken on an empty stomach, but always after the three principal meals of the day.

Each Capsule contains One-tenth (0.1) Gramme (two minims) C. P. CREASOTE FROM Beech-wood-tar

Prof. Sommerbrodt's CREASOTE CAPSULES

C.P. Creasote, from Beechwood-tar, with Cod Liver Oil.

DOSE: TEN TO FORTY CAPSULES PER DAY.

DIRECTIONS:—As instructed by Prof. Sommerbrodt, these capsules contain each 0,1 gramme (2 minims) of C. P. Creasote, from Beech-wood-tar, with suitable cod liver oil vehicle. The dose for patients over ten years of age is at least 10 capsules (1 gramme) per day, to be increased in accordance with indications in each case—age, constitution, severity of disease, etc.—to as much as 40 capsules (4 grammes) per day.

"The more Creasote the patient can tolerate each day the greater the benefit."

LEHN & FINK,

Wholesale Druggists, NEW YORK.

C. P. CREASOTE FOR TUBERCULOSIS.—SOMMERBRODT (*Berliner klin. Woch.*, October 19, 1891) reaffirms his faith in creasote, both for incipient and for advanced cases of tuberculosis, pulmonary as well as laryngeal. Complete and permanent recovery is by no means uncommon even in persons in whom a tuberculous predisposition existed. Large doses (♏ xv to ʒ j *per diem*) are most beneficial. Indeed, the more the patient can tolerate the greater the benefit derived. SOMMERBRODT administers creasote in the form of capsules, each containing about ♏ ii of creasote with a little cod-liver oil. There are very few persons with whom the drug disagrees, and in no case has he seen any harm done by its administration.—*British Medical Journal.*

These Capsules are put up in glass tubes, 100 in each tube, and can be obtained from retail and wholesale druggists in all parts of the United States. Physicians sending request, with ten cents in stamps, and mentioning this journal, will receive sample of capsules free by mail.

1844.

1893.

AMERICA'S VENERABLE AND ONLY WEEKLY ECLECTIC.

For Nearly Fifty Years

Littell's Living Age

Has stood peerless in the realm of periodical literature.

It selects from the whole wide field of EUROPEAN PERIODICAL LITERATURE the best articles by

THE ABLEST LIVING WRITERS

in every department,

Biography, History, Literature, Travels, Science, Politics, Criticism, Art, Fiction and Poetry.

"Only the best has ever filled its pages; the best thought rendered in the purest English. Nothing poor or unworthy has ever appeared in the columns of THE LIVING AGE."—*The Presbyterian, Philadelphia, April* 13, 1892.

A Weekly Magazine, it gives more than

Three and a Quarter Thousand double-column octavo Pages

of reading matter yearly forming four volumes; presenting a mass of matter **Unequaled in Quality and Quantity** by any other publication in the country.

The quickened interest in things historical, has enabled the publishers to make a **Most Happy Arrangement** whereby they can present one of

THE MOST LIBERAL OFFERS

ever made for the consideration of an intelligent class of American readers, viz.: a

$5.00 Copy of

Ridpath's History of the United States

At the Nominal Price of 50 cents

when taken in connection with THE LIVING AGE.

Littell's Living age, one year, postpaid, $8.00
Ridpath's History of the U. S. of America, 5.00 } **FOR $8.50**

This history has received the emphatic endorsement of leading educators and of the press of America.

The Publishers of THE LIVING AGE are having prepared for their use A SPECIAL EDITION of this great work, which, by the addition of new matter appearing in no previous edition, will bring the history down to the present time. It will be printed in bold, clear type, on heavy, white, book paper and bound in extra fine cloth, making one large Royal Octavo volume of over 800 pages.

SEND FOR DESCRIPTIVE CIRCULARS.

The price given above includes postage on THE LIVING AGE *only. The book must be sent at the subscriber's expense.*

THE LIVING AGE is published weekly at $8.00 a year, free of postage.

TO NEW SUBSCRIBERS FOR THE YEAR 1893 will be sent *gratis* the two October issues containing a powerful story by Frank Harris, *Editor of* THE FORTNIGHTLY REVIEW, entitled PROFIT AND LOSS.

Club-Prices for the best Home and Foreign Literature.

["Possessed of THE LIVING AGE and one or other of our vivacious American monthlies, a subscriber will find himself *in command of the whole situation.—Phila. Ev. Bulletin.*]

For $10.50, THE LIVING AGE and any one of the American $4 monthlies (or *Harper's Weekly* or *Bazar*) will be sent for a year, postpaid; or, for $9.50 THE LIVING AGE and *Scribner's Magazine* or the *St. Nicholas.*

Rates for clubbing THE LIVING AGE with more than one other periodical will be sent on application.

Sample copies of THE LIVING AGE, 15 cents each, address

LITTELL & CO., Boston.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. **A NON-ALCOHOLIC LIQUID.** WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,

WASHINGTON, D. C.

Derangements of the Liver.

HORSFORD'S ACID PHOSPHATE.

has been used with good effect in diseases of the liver, and biliary disorders, where an acid treatment is indicated, and has especially proved a desirable medium to employ in chronic hepatic affections. By its action it stimulates the liver and promotes an increased flow of bile.

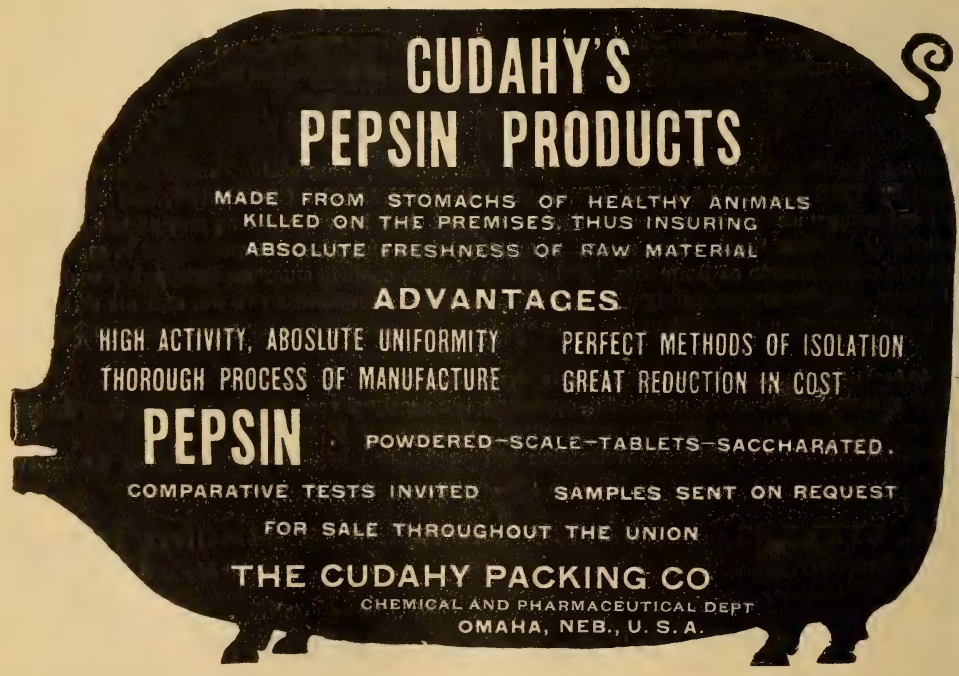
The Acid Phosphate is far superior to the nitro-muriatic acid of the pharmacopœia, in that it serves to assist digestion, and promotes in a marked degree the healthful action of the digestive organs.

Dr. O. G. CILLEY, of Boston, says: "I give it in all cases where there is derangement of the liver, with the most remarkable success. With my patients it has agreed wonderfully."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.



Sample, sufficient for a practical test, sent free

7 Reasons why Papoid is Superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers. read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia, President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

DR. WM. A. HAMMOND'S PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cablecars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

Our new

PRESCRIPTION CASE

is the most complete and handiest case in the market.

JOHN J. WOOD

1345 ARCH STREET PHILADELPHIA, PA.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil.....80 m. (drops)		Soda.....1-2 Grains	
Distilled Water.....35 "		Salicylic Acid.....1-4 "	
Soluble Pancreatin..... 5 Grains.		Hyocholic Acid.....1-30 "	

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

LONDONDERRY LITHIA

Has received the highest possible endorsement from the physicians of America, as a medicinal or table water.

When in doubt, give us a chance to furnish the water free for any clinical test. It won't cure everything, but there are many cases of Lithaemia in which either the still or sparkling "Londonderry" will give great satisfaction.

Sparkling "Londonderry" has no peer as a table or club water

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

BOSTON.

Upon receipt of twenty cents in stamps, we will mail to anyone our Standard Diary for 1893, containing Calendar, Obstetric Ready Reckoner, Antidotes for Poisons, Important Incompatibles, Disinfectants, Weights and Measures, average and maximum doses of Drugs and a Standard Diary with blank pages for memoranda.

McARTHUR HYPOPHOSPHITE CO., Boston, Mass.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, $6.00
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M. D., Professor of Clinical Surgery.
JOHN GUITERAS, M. D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M. D., Professor of Anatomy.
JOHN MARSHALL, M. D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M. D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M. D., LL. D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.
Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.
Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

The Treatment for Consumption

which has received the greatest measure of approval from the medical profession is that known as

"Sommerbrodt's Creasote Treatment for Tuberculosis"

PROF. DR. JULIUS SOMMERBRODT'S latest reports on the use of C. P. Creasote for the cure of tuberculosis (*Berliner Klinische Wochenschrift*, No. 43, Oct., 1891), giving the results and conclusions of an experience in many thousands of cases extending over twelve years, has aroused new interest in, and induced the general adoption of his method of treatment. He uses and recommends the capsules herein contained, and disapproves of administering creasote in any different form, particularly objecting to the combination with balsam of tolu, and the pill form. The remedy should never be taken on an empty stomach, but always after the three principal meals of the day.

Each Capsule contains One-tenth (0.1) Gramme (two minims) C. P. CREASOTE FROM Beech-wood-tar

Prof. Sommerbrodt's CREASOTE CAPSULES

C.P. Creasote, from Beechwood-tar, with Cod Liver Oil.

DOSE: TEN TO FORTY CAPSULES PER DAY.

DIRECTIONS:—As instructed by Prof. Sommerbrodt, these capsules contain each 0,1 gramme (2 minims) of C. P. Creasote, from Beech-wood-tar, with suitable cod liver oil vehicle. The dose for patients over ten years of age is at least 10 capsules (1 gramme) per day, to be increased in accordance with indications in each case—age, constitution, severity of disease, etc.—to as much as 40 capsules (4 grammes) per day.

"The more Creasote the patient can tolerate each day the greater the benefit."

Wholesale Druggists, NEW YORK.

C. P. CREASOTE FOR TUBERCULOSIS.—SOMMERBRODT (*Berliner klin. Woch.*, October 19, 1891) reaffirms his faith in creasote, both for incipient and for advanced cases of tuberculosis, pulmonary as well as laryngeal. Complete and permanent recovery is by no means uncommon even in persons in whom a tuberculous predisposition existed. Large doses (m xv to ʒ j *per diem*) are most beneficial. Indeed, the more the patient can tolerate the greater the benefit derived. SOMMERBRODT administers creasote in the form of capsules, each containing about m ii of creasote with a little cod-liver oil. There are very few persons with whom the drug disagrees, and in no case has he seen any harm done by its administration.—*British Medical Journal.*

These Capsules are put up in glass tubes, 100 in each tube, and can be obtained from retail and wholesale druggists in all parts of the United States. Physicians sending request, with ten cents in stamps, and mentioning this journal, will receive sample of capsules free by mail.

1893.

AMERICA'S VENERABLE AND ONLY WEEKLY ECLECTIC.

For Nearly Fifty Years

Littell's Living Age

Has stood peerless in the realm of periodical literature.

It selects from the whole wide field of EUROPEAN PERIODICAL LITERATURE the best articles by

THE ABLEST LIVING WRITERS

in every department,

Biography, History, Literature, Travels, Science, Politics, Criticism, Art, Fiction and Poetry.

"Only the best has ever filled its pages; the best thought rendered in the purest English. Nothing poor or unworthy has ever appeared in the columns of THE LIVING AGE."—*The Presbyterian, Philadelphia, April 13, 1892.*

A Weekly Magazine, it gives more than

Three and a Quarter Thousand double-column octavo Pages

of reading matter yearly forming four volumes; presenting a mass of matter **Unequaled in Quality and Quantity** by any other publication in the country.

The quickened interest in things historical, has enabled the publishers to make a **Most Happy Arrangement** whereby they can present one of

THE MOST LIBERAL OFFERS

ever made for the consideration of an intelligent class of American readers, viz.: a

$5.00 Copy of

Ridpath's History of the United States

At the Nominal Price of 50 cents

when taken in connection with THE LIVING AGE.

Littell's Living age, one year, postpaid, $8.00
Ridpath's History of the U. S. of America, 5.00 } **FOR $8.50**

This history has received the emphatic endorsement of leading educators and of the press of America.

The Publishers of THE LIVING AGE are having prepared for their use A SPECIAL EDITION of this great work, which, by the addition of new matter appearing in no previous edition, will bring the history down to the present time. It will be printed in bold, clear type, on heavy, white, book paper and bound in extra fine cloth, making one large Royal Octavo volume of over 800 pages.

SEND FOR DESCRIPTIVE CIRCULARS.

The price given above includes postage on THE LIVING AGE *only. The book must be sent at the subscriber's expense.*

THE LIVING AGE is published weekly at $8.00 a year, free of postage.

TO NEW SUBSCRIBERS FOR THE YEAR 1893 will be sent *gratis* the two October issues containing a powerful story by Frank Harris, *Editor of* THE FORTNIGHTLY REVIEW, entitled PROFIT AND LOSS.

Club-Prices for the best Home and Foreign Literature.

["Possessed of THE LIVING AGE and one or other of our vivacious American monthlies, a subscriber will find himself *in command of the whole situation.—Phila. Ev. Bulletin.*]

For $10.50, THE LIVING AGE and any one of the American $4 monthlies (or *Harper's Weekly* or *Bazar*) will be sent for a year, postpaid; or, for $9.50 THE LIVING AGE and *Scribner's Magazine* or the *St. Nicholas.*

Rates for clubbing THE LIVING AGE with more than one other periodical will be sent on application.

Sample copies of THE LIVING AGE, 15 cents each, address

PRESCRIPTION CASE

is the most complete and handiest case in the market.

JOHN J. WOOD

1345 ARCH STREET PHILADELPHIA, PA

DÉVIATION DES RÈGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc., all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

BOOK BARGAINS FOR SUBSCRIERS.

In accordance with the long practice of THE REPORTER we offer the following bargains in books for new subscribers. We have secured these books by special arrangement with P. Blakiston, Son & Co., and it is only by purchasing a large number of each that we are able to offer them at this price. Please note the publisher's regular price and compare with that at which they are given in connection with THE REPORTER. We have selected these books solely because we believe them to be the best and most useful books on the market for the working practitioner.

JACOBSON'S OPERATIONS OF SURGERY. Latest American Edition. 1006 pages, large octavo. Several hundred illustrations. The author is one of the most prominent surgeons in England, and this book is recognized as an authoritative work. *Publisher's Price $5.00.*

The above with THE REPORTER for one year, postpaid, $7.75.

POTTER'S MATERIA MEDICA, PHARMACY AND THERAPEUTICS. This is the very latest edition, bearing the imprint of 1893, and is pronounced the most useful and practical of any book of the kind. It includes the PHYSIOLOGICAL ACTION OF DRUGS, THE SPECIAL THERAPEUTICS OF DISEASE, OFFICIAL AND PRACTICAL PHARMACY, AND MINUME DIRECTIONS FOR PRESCRIPTION WRITING. The author has a fine reputation from his previous works and his professional reputation in the best institutions of the country. *Publisher's Price $4.00.*

The above with THE REPORTER, one year, postpaid, $7.85

DISEASES OF CHILDREN, by James Frederic Goodhart, edited by Louis Starr. The names of these men are a guarantee of the usefulness of this work. This is the second American edition, clear print, handy size. Has 770 pages including a copious index. *Publisher's Price $3.00.*

The above with THE REPORTER, one year, postpaid, $7.00.

GOULD'S DICTIONARY OF MEDICINE is a compact, concise volume of 500 pages, the work based on the most recent medical literature, and containing elaborate tables and appendices—in fact comprising everything that can be useful to the busy doctor. As the author says, it would not have been half the trouble to have made a volume double or treble the size. *Publisher's Price $3.25.*

The above with THE REPORTER, one year, postpaid, $7.25.

Address, in every case enclosing check or money order.

HYGIENIC AGENTS.

Dietetic Waters, more generally called Table Waters, *if pure,* are of great value as hygienic agents, says the N. Y. Medical Journal.

The lay public, however, are apt to confound Table Waters with Medicinal Waters containing active chemical substances which cannot safely be included as part of the ordinary daily diet.

The British Medical Journal says that Apollinaris *reigns alone* among Natural Dietetic Table Waters.

For Pamphlets,

ADDRESS CHARLES GRAEF & CO., 32 BEAVER STREET, NEW YORK.

ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alteratives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequalled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alteratives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.].

Among laxatives we have many formulæ. As a general laxative, Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that Nature cannot alone restore lost function. The duty of the doctor to the patient is, in prescribing, to specify drugs the purity of which he can vouch for.

A physician with life dependent upon his efforts, equipped with a thorough medical education, with a full appreciation of the case in hand, and who with reliable drugs could effect a cure, often prescribes his remedies with no knowledge of their manufacture, and therefore of their quality.

We invite correspondence from the profession concerning our products, and will afford all information regarding them desired.

PARKE, DAVIS & CO.,

DETROIT AND NEW YORK.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

CALIFORNIA FIG SYRUP COMPANY

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

THE SECRET OF ITS SUCCESS

(we refer to MERCK'S BULLETIN) is its distinctive character. Some journals are devoted to the expansion of a single man's ideas or the advancement of a special theory. MERCK'S BULLETIN is a comprehensive, well-rounded, clearly-outlined review of the entire field. It offers just what the busy physician or surgeon desires to know. This is the reason that many hundreds of new names are added every month to its subscription list.

If you do not know the journal and want to examine it, a copy will be cheerfully forwarded without expense.

PERFECT PILL PREPARATIONS

Of W. H. SCHIEFFELIN & Co., New York, we venture to suggest that, in prescribing, you specify "W. H. S. & Co.," as marked in the following brief, but always seasonable, selections from our lists:

Pil. Phenacetine et Salophen
"W. H. S. & Co."

For Influenza, (La Grippe,) Acute Rheumatism, Neuralgia, Migraine, Pertussis, and all painful febrile conditions. (Pills of 5 grains each, containing 2½ grains each of Phenacetine-Bayer and Salophen; half strength also.)

Pil. Terpin Hydrat
"W. H. S. & Co."

For Coughs, Colds, Catarrh, Bronchitis and all Acute and Chronic Respiratory Maladies. No unpleasant symptoms follow the continuous use of Terpin Hydrat. (Pills of 2 and 5 grains each.)

Pil. Ferri, Quiniae et Strychniae
"W. H. S. & Co."

For the various forms of Asthenia, and especially for slow Convalescence from Acute Maladies. An excellent pill for the Debility following Malaria. (Pills of 2 1-60 grains each.)

Pil. Phenacetine-Bayer
"W. H. S. & Co."

For All Forms of Fever, Pain, Rheumatism and Neuralgia; for Pertussis, and for conditions in which both pain and fever are to be combated. (Pills of 2, 3, 4 and 5 grains each.)

Pil. Aloin, Strychniae et Belladonnae
"W. H. S. & Co."

For Constipation dependent upon Lack of Tone in the Digestive Organs. It is useful also as an Occasional Laxative and well liked by Patients.

Pil. Quiniae, Ferri et Zinci Valerianat
"W. H. S. & Co."

For Nervous Tension, Melancholia, Epilepsy, Hysteria, Delirium Tremens, Dysmenorrhœa, and all Neuroses dependent upon the cares of life. (Pills of 3 grains.)

W. H. Schieffelin & Co., New York.

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

The Treatment for Consumption

which has received the greatest measure of approval from the medical profession is that known as

"Sommerbrodt's Creasote Treatment for Tuberculosis"

PROF. DR. JULIUS SOMMERBRODT'S latest reports on the use of C. P. Creasote for the cure of tuberculosis (*Berliner Klinische Wochenschrift*, No. 43, Oct., 1891), giving the results and conclusions of an experience in many thousands of cases extending over twelve years, has aroused new interest in, and induced the general adoption of his method of treatment. He uses and recommends the capsules herein contained, and disapproves of administering creasote in any different form, particularly objecting to the combination with balsam of tolu, and the pill form. The remedy should never be taken on an empty stomach, but always after the three principal meals of the day.

Each Capsule contains One-tenth (0.1) Gramme (two minims) C. P. CREASOTE FROM Beech-wood-tar

Prof. Sommerbrodt's CREASOTE CAPSULES

C.P. Creasote, from Beechwood-tar, with Cod Liver Oil.

DOSE: TEN TO FORTY CAPSULES PER DAY.

DIRECTIONS:—As instructed by Prof. Sommerbrodt, these capsules contain each 0,1 gramme (2 minims) of C. P. Creasote, from Beech-wood-tar, with suitable cod liver oil vehicle. The dose for patients over ten years of age is at least 10 capsules (1 gramme) per day, to be increased in accordance with indications in each case—age, constitution, severity of disease, etc.—to as much as 40 capsules (4 grammes) per day.

"The more Creasote the patient can tolerate each day the greater the benefit."

C. P. CREASOTE FOR TUBERCULOSIS.—SOMMERBRODT (*Berliner klin. Woch.*, October 19, 1891) reaffirms his faith in creasote, both for incipient and for advanced cases of tuberculosis, pulmonary as well as laryngeal. Complete and permanent recovery is by no means uncommon even in persons in whom a tuberculous predisposition existed. Large doses (℥ xv to ʒ j *per diem*) are most beneficial. Indeed, the more the patient can tolerate the greater the benefit derived. SOMMERBRODT administers creasote in the form of capsules, each containing about ℥ ii of creasote with a little cod-liver oil. There are very few persons with whom the drug disagrees, and in no case has he seen any harm done by its administration.—*British Medical Journal.*

These Capsules are put up in glass tubes, 100 in each tube, and can be obtained from retail and wholesale druggists in all parts of the United States. Physicians sending request, with ten cents in stamps, and mentioning this journal, will receive sample of capsules free by mail.

For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac. Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up." This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R. WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Gingerine . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ⅛ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indigestion, and will afford permanent benefit in cases of enfeebled digestion, where the gastric juices are not properly secreted. As a dinner pill, Pil. Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . 1 gr. | Concentrated Pepsin 1 gr.
Ext. Nux Vomica ⅛ gr. | Dose—1 to 3 pills.

Pil. Antiseptic Comp. is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

7 Reasons why Papoid is Superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments." (KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers." (WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,

WASHINGTON, D. C.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR
BUFFALO LITHIA SPRINGS, VA.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

ST. LOUIS, MO.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

SHARP & DOHME,

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1;"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention *"COLDEN'S,"* viz., *"Ext. Carnis Fl. Comp. (Colden)."* A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞ With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

NEW YORK.

Horace Tracy Hanks, M. D., *Memver of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

An "Ideal Disinfectant" and Antiseptic.

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

PRESCRIPTION CASE

is the most complete and handiest case in the market.

JOHN J. WOOD

1345 ARCH STREET PHILADELPHIA, PA

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS**. One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

LONDONDERRY LITHIA

Has received the highest possible endorsement from the physicians of America, as a medicinal or table water.

When in doubt, give us a chance to furnish the water free for any clinical test. It won't cure everything, but there are many cases of Lithaemia in which either the still or sparkling "Londonderry" will give great satisfaction.

Sparkling "Londonderry" has no peer as a table or club water

Londonderry Lithia Spring Water Co.

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

Sole Agents in the United States and Canada of
THE APOLLINARIS COMPANY, LIMITED, LONDON.

ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alteratives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequalled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alteratives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.].

Among laxatives we have many formulæ. As a general laxative, Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that Nature cannot alone restore lost function. The duty of the doctor to the patient is, in prescribing, to specify drugs the purity of which he can vouch for.

A physician with life dependent upon his efforts, equipped with a thorough medical education, with a full appreciation of the case in hand, and who with reliable drugs could effect a cure, often prescribes his remedies with no knowledge of their manufacture, and therefore of their quality.

We invite correspondence from the profession concerning our products, and will afford all information regarding them desired.

PARKE, DAVIS & CO.,

DETROIT AND NEW YORK.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

BROMIDIA

THE HYPNOTIC.

FORMULA.—

Every fluid drachm contains 15 grains EACH of Pure Chloral Hydrat. and purified Brom. Pot., and one-eighth grain EACH of gen. imp. ext. Cannabis Ind. and Hyoscyam.

DOSE.—

One-half to one fluid drachm in WATER or SYRUP every hour, until sleep is produced.

INDICATIONS.—

Sleeplessness, Nervousness, Neuralgia, Headache, Convulsions, Colic, Mania, Epilepsy, Irritability, etc. In the restlessness and delirium of fevers it is absolutely invaluable.

IT DOES NOT LOCK UP THE SECRETIONS.

PAPINE

THE ANODYNE.

Papine is the Anodyne or pain-relieving principle of Opium, the Narcotic and Convulsive Elements being eliminated. It has less tendency to cause Nausea, Vomiting, Constipation, Etc.

INDICATIONS.—

Same as Opium or Morphia.

DOSE.—

(ONE FLUID DRACHM)—represents the Anodyne principle of one-eighth grain of Morphia.

IODIA

The Alterative and Uterine Tonic.

FORMULA.—

Iodia is a combination of active principles obtained from the Green Roots of Stillingia, Helonias, Saxifraga, Menispermum, and Aromatics. Each fluid drachm also contains five grains Iod. Potas., and three grains Phos. Iron.

DOSE.—

One or two fluid drachms (more or less as indicated) three times a day before meals.

INDICATIONS.—

Syphilitic, Scrofulous and Cutaneous Diseases, Dysmenorrhea, Menorrhagia, Leucorrhea, Amenorrhea, Impaired Vitality, Habitual Abortions, and General Uterine Debility.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

7 Reasons Why Papoid is Superior to Pepsin

1 Digestive Power

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments." (KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 Acts Throughout Entire Alimentary Canal

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 Stimulates Natural Digestion

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 Acts in Acid, Alkaline, or Neutral Media

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 Acts on All Kinds of Food. Can be Combined with Antiseptics

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers." (WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 Acts in the Intestines

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 Costs Less

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.

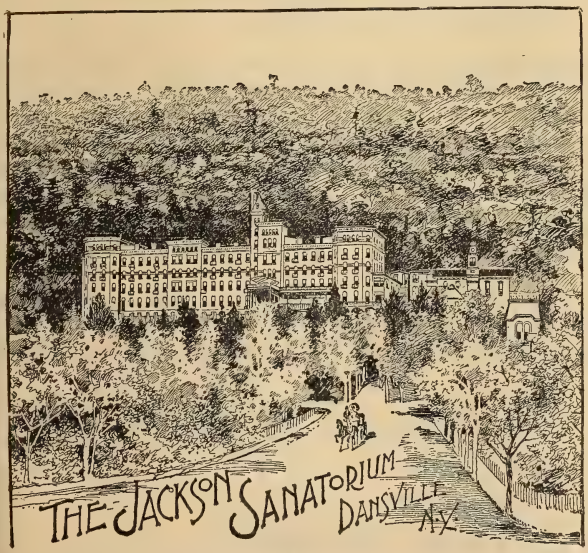
HEALTH! REST!

TO PHYSICIANS

Desiring to send patients away from home for change of scene, in connection with systematic regimen and oversight.



THE JACKSON SANATORIUM

offers exceptional advantages and attractions.

This institution is under the personal care of a permanent staff of regularly educated and experienced physicians.

Location, 1,200 feet above sea level, in a woodland park, overlooking charming upland and valley views of Genesee region. Pure spring water from rocky heights. Clear, dry atmosphere, free from fogs and malaria. Perfect drainage and sewerage systems. Delightful walks and drives.

Elegant (brick and iron) fire-proof main building and twelve cottages, steam heated, and designed to meet every requirement of invalids, or seekers of rest and quiet.

Extensive apartments for treatment arranged for individual privacy. Skilled attendants. All forms of baths, Electricity, Massage, Swedish Movements, etc., scientifically administered.

Culinary Department under Supervision of Mrs. Emma P. Ewing, Superintendent of the Chautauqua Cooking School, whose reputation as a teacher of scientific and hygienic cooking is national.

Comfort without care; freedom from taxations of fashionable life and from the excitements and temptations of popular resorts. Especial provisions for quiet and rest, also for recreation, amusement, and regular out-door life. Telegraph, telephone, electric bells, safety elevator, open fires, and all modern appliances for comfort and health. On direct line of Del. Lack. & West. R. R. between New York City and Buffalo. Only 9 hours from New York.

Established in 1858.
Open all the year.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR
BUFFALO LITHIA SPRINGS, VA.

Dr. J. FEHR'S "COMPOUND TALCUM" * * * * "BABY POWDER,"

THE

"HYGIENIC DERMAL POWDER"

FOR

INFANTS AND ADULTS.

"Originally investigated and its therapeutic properties discovered in the year 1868, by Dr. Fehr, and introduced to the medical and the pharmaceutical professions in the year 1873."

COMPOSITION:—Silicate of Magnesia with Carbolic and Salicylic Acids.

PROPERTIES:—Antiseptic, Antizymotic, and Disinfectant.

Useful as a **GENERAL SPRINKLING POWDER,** with positive Hygienic, Prophylactic, and Therapeutic properties.

GOOD IN ALL AFFECTIONS OF THE SKIN.

PER BOX, PLAIN, 25 Cents; PERFUMED, 50 Cents.
PER DOZ., PLAIN, $1.75; PERFUMED, $3.50.

BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

BRANCH HOUSES
NEW YORK
CHICAGO

SHARP & DOHME,
Baltimore, Md., U. S. A.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:

Pure Cod Liver Oil	30 m. (drops)	Soda	1-3 Grains
Distilled Water	35 "	Salicylic Acid	1-4 "
Soluble Pancreatin	5 Grains.	Hyocholic Acid	1-30 "

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable,—supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

C. N. CRITTENTON,

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞ With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{15}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

THE APOLLINARIS COMPANY, LIMITED, LONDON.

ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alteratives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequalled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alteratives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.].

Among laxatives we have many formulæ. As a general laxative, Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that Nature cannot alone restore lost function. The duty of the doctor to the patient is, in prescribing, to specify drugs the purity of which he can vouch for.

A physician with life dependent upon his efforts, equipped with a thorough medical education, with a full appreciation of the case in hand, and who with reliable drugs could effect a cure, often prescribes his remedies with no knowledge of their manufacture, and therefore of their quality.

We invite correspondence from the profession concerning our products, and will afford all information regarding them desired.

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation."**

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

Pharmaceutical Specialties of

The Farbenfabriken

vorm Friedr Bayer & Co.

NEW

Salophen

THE NEW ANTIRHEUMATIC

SALOPHEN is strongly recommended by recent observers as having a very remarkable controlling influence over acute, articular rheumatism. It is a new salicylo-phenolic derivative so combined as to be perfectly innocuous. *Supplied in ounces tablets and pills.*

Europhen

SUBSTITUTE FOR IODOFORM

EUROPHEN is a complete substitute for iodoform and is indicated in specific lesions, burns, ulcerations, and all external traumatisms. It has an agreeable odor, and covers five times more surface than iodoform. *Europhen and Europhen-Aristol are supplied in ounces.*

Losophan

ANTIMYCOTIC, PARASITICIDE

LOSOPHAN is a new remedy (*tri-iodo-cresol*), especially indicated in herpes tonsurans, or ringworm, scabies, mycosis, pityriasis versicolor, acne, the parasitical dermatoses, and for pediculi. It should be tested in the various fungoid conditions. *Ounces.*

W H Schieffelin & Co

NEW YORK

Sole Agents and Sole Licensees for the U. S.

OTHER PRODUCTS OF THE FARBENFABRIKEN ARE DESIGNATED BELOW

ARISTOL

ANTISEPTIC, CICATRISANT

ARISTOL is now widely known as a very safe, pleasant and effective surgical dressing. It is especially useful in leg ulcers, cavital ulcerations, ozena, etc., and where prompt cicatrisation is desired. *Aristol and Europhen-Aristol are supplied in ounces.*

TRIONAL

NERVE SEDATIVE, HYPNOTIC

TRIONAL acts promptly and decidedly in the neuroses and the insomnias. It is an excellent hypnotic and sedative and without unpleasant results when properly administered. Indicated in certain obstinate neuroses and their result insomnias. *Supplied in ounces.*

PHENACETINE-BAYER

ANTIPYRETIC, ANALGESIC.

PHENACETINE is justly regarded as the safest and most effective of ANTIPYRETICS and ANALGESICS. It is indicated in all acute, inflammatory fevers, the pneumonias, the exanthemata, *la grippe*, migraine, neuralgia, rheumatism, etc. *Ounces, tablets and pills.*

SULFONAL-BAYER

HYPNOTIC, NERVE SEDATIVE

SULFONAL is the safest and most effective of hypnotics and nerve sedatives and is indicated in all the insomnias and neuroses. It induces physiological sleep, free from narcosis and sequelæ. If pain is present, Phenacetine may be combined with it. *Ounces, tablets and pills.*

PHENACETINE-BAYER has the decided and unreserved approval of physicians as being the most eligible ANALGIC and FEBRICANT now employed in general practice. Its special indications have naturally widened with use. For an account of them see our recently-issued pamphlet.

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

CINCINNATI, O.

SMITH, KLINE & FRENCH CO., PHILADELPHIA.

7 Reasons why Papoid is Superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.*, says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

The Anodyne principle of Opium; the narcotic and convulsive elements being eliminated. Dose—One fld. drachm, represents ⅛ gr. morphia in anodyne principle.

IODIA.

A combination of active principles of Stillingia, Helonias, Saxifraga, Menispermum and Aromatics. Each fld. dr. contains 5 grs. Iod. Potas. and 3 grs. Phos. Iron. Dose—One or two fld. drachms as indicated.

BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, "**With Iron, No. 1**;" while the same preparation, **Without Iron,** is designated on the label as "**No. 2.**"

In prescribing this preparation, physicians should be particular to mention "*COLDEN'S*," viz., "*Ext. Carnis Fl. Comp.* (*Colden*)." A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. ***Sold by druggists generally.***

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

BOSTON.

Upon receipt of twenty cents in stamps, we will mail to anyone our Standard Diary for 1893, containing Calendar, Obstetric Ready Reckoner, Antidotes for Poisons, Important Incompatibles, Disinfectants, Weights and Measures, average and maximum doses of Drugs and a Standard Diary with blank pages for memoranda.

McARTHUR HYPOPHOSPHITE CO., Boston, Mass.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{15}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

Health Restorative Company

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

THE APOLLINARIS COMPANY, LIMITED, LONDON.

ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alteratives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequalled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alteratives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.].

Among laxatives we have many formulæ. As a general laxative, Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that Nature cannot alone restore lost function. The duty of the doctor to the patient is, in prescribing, to specify drugs the purity of which he can vouch for.

A physician with life dependent upon his efforts, equipped with a thorough medical education, with a full appreciation of the case in hand, and who with reliable drugs could effect a cure, often prescribes his remedies with no knowledge of their manufacture, and therefore of their quality.

We invite correspondence from the profession concerning our products, and will afford all information regarding them desired.

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

BROMIDIA.

Each fld. dr. contains 15 gr. *each* Pure Chloral Hydrat. and Purified Brom. Pot., and ⅛ gr. *each* Cannabis Indica and Hyoscyam. Dose—One-half to one fld. drachm in water or syrup.

PAPINE.

The Anodyne principle of Opium; the narcotic and convulsive elements being eliminated. Dose—One fld. drachm, represents ⅛ gr. morphia in anodyne principle.

IODIA.

A combination of active principles of Stillingia, Helonias, Saxifraga, Menispermum and Aromatics. Each fld. dr. contains 5 grs. Iod. Potas. and 3 grs. Phos. Iron. Dose—One or two fld. drachms as indicated.

BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails.

A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc.

THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

DR. MASSEY'S
PRIVATE SANATORIUM.

Presenting the comforts of an elegant private residence, this institution is specially equipped for the use of electricity and allied remedial measures in the diseases of women and in diseases of the nervous system. For particulars address

G. BETTON MASSEY, M.D.,
212 S. Fifteenth St., Philadelphia.

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞ With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

THE BALTIMORE MEDICAL COLLEGE.

Preliminary Fall Course began Sept. 1, 1892.
Regular Winter Course begins October 1, 1892.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)"

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

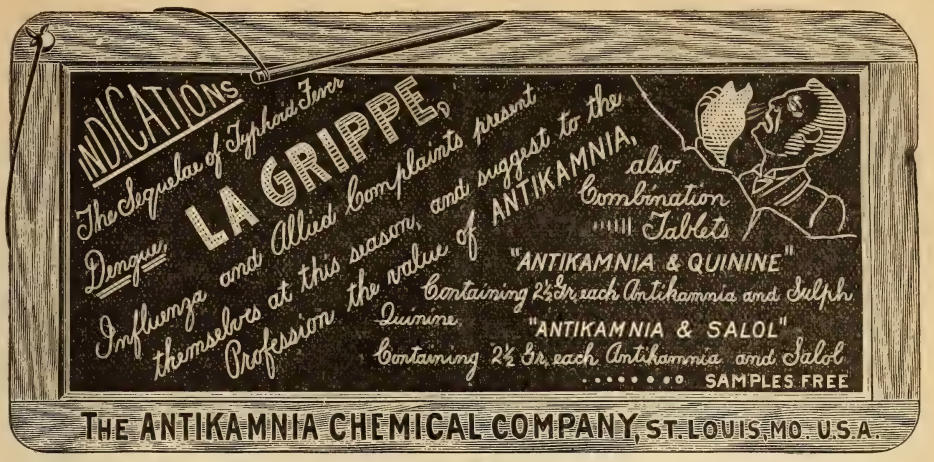
JOHN J. WOOD

1345 ARCH STREET PHILADELPHIA, PA

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.



INDICATIONS
The Sequelæ of Typhoid Fever
Dengue, LA GRIPPE,
Influenza and Allied Complaints present themselves at this season, and suggest to the Profession the value of ANTIKAMNIA,

Derangements of the Liver.

HORSFORD'S ACID PHOSPHATE.

has been used with good effect in diseases of the liver, and biliary disorders, where an acid treatment is indicated, and has especially proved a desirable medium to employ in chronic hepatic affections. By its action it stimulates the liver and promotes an increased flow of bile.

The Acid Phosphate is far superior to the nitro-muriatic acid of the pharmacopœia, in that it serves to assist digestion, and promotes in a marked degree the healthful action of the digestive organs.

Dr. O. G. CILLEY, of Boston, says: "I give it in all cases where there is derangement of the liver, with the most remarkable success. With my patients it has agreed wonderfully."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on applicatio without expense, except express charges.

7 Reasons why Papoid is Superior to Pepsin

1 Digestive Power

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 Acts Throughout Entire Alimentary Canal

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 Stimulates Natural Digestion

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 Acts in Acid, Alkaline, or Neutral Media

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers, read before Philadelphia County Medical Society.)

5 Acts on All Kinds of Food. Can be Combined with Antiseptics

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 Acts in the Intestines

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 Costs Less

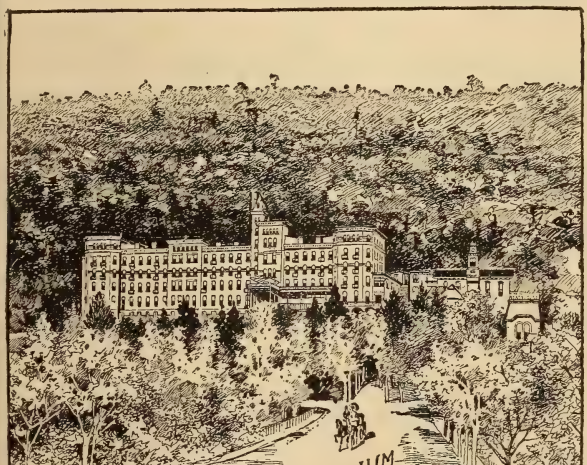
AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

HEALTH! REST!

TO PHYSICIANS

Desiring to send patients away from home for change of scene, in connection with systematic regimen and oversight.



THE JACKSON SANATORIUM

offers exceptional advantages and attractions

This institution is under the personal care of a permanent staff of regularly educated and experienced physicians

Location, 1,200 feet above sea level, in a woodland park, overlooking charming upland and valley views of Genesee region. Pure spring water from rocky heights. Clear, dry atmosphere, free from fogs and malaria. Perfect drainage and sewerage systems. Delightful walks and drives.

Elegant (brick and iron) fire-proof main building and twelve cottages, steam heated, and designed to meet every requirement of invalids, or seekers of rest and quiet.

Extensive apartments for treatment arranged for individual privacy. Skilled attendants. All forms of baths, Electricity, Massage, Swedish Movements, etc., scientifically administered.

Culinary Department under Supervision of Mrs. Emma P. Ewing, Superintendent of the Chautauqua Cooking School, whose reputation as a teacher of scientific and hygienic cooking is national.

Comfort without care; freedom from taxations of fashionable life and from the excitements and temptations of popular resorts. Especial provision for quiet and rest, also for recreation, amusement, and regular out-door life.

Telegraph, telephone, electric bells, safety elevator, open fires, and all modern appliances for comfort and health

On direct line of Del. Lack. & West. R. R. between New York City and Buffalo. Only 9 hours from New York.

Established in 1858.
Open all the year.

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is **a remedy of decided efficiency in the Lithaemic condition.**"

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

BRANCH HOUSES
NEW YORK
CHICAGO

SHARP & DOHME,
Baltimore, Md., U. S. A.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:

Pure Cod Liver Oil.....80 m. (drops)	Soda.....1-3 Grains.
Distilled Water.....35 "	Salicylic Acid.....1-4 "
Soluble Pancreatin..... 5 Grains.	

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of polypharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

McArthur's Syrup has wonderful healing and tonic properties.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., of Philadelphia, and many more Eminent Physicians.

Any Physician not familiar with McArthur's Syrup of the Hypophosphites Comp. (Lime and Soda), and willing to pay express charges will receive a bottle free on application.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites Prepared expressly for Physicians' use.

McARTHUR HYPOPHOSPHITE CO.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M. D., LL. D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M. D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

Health Restorative Company

90 South Fifth Avenue, New York

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

JOHN J. WOOD

1345 ARCH STREET PHILADELPHIA, PA

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

DEAR DOCTOR:

I have met you before and trust you remember me pleasantly. I am doing my best to prove worthy the confidence you impose in me. If you have a bad case of Rheumatism, Gout, Gravel, or any form of Uric Acid poisoning, send for me. I am not a cure all, but I know how to assist you in getting these poisons out of the system. I adopt the "American idea" so that I may not be mixed up with my foreign rivals. American products for Americans is the popular sentiment. If you wish to know who my friends are, send me word. I have a list of the most eminent physicians in the world who are always glad to say a kind word for me. If you doubt my ability to control disease, I will do my best to convince you without charge. My offices are:

"Selling Agents."

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

CHARLES GRAEF & CO.,

Sole Agents in the United States and Canada of
THE APOLLINARIS COMPANY, LIMITED, LONDON

ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alteratives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequalled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alteratives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.].

Among laxatives we have many formulæ. As a general laxative, Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that Nature cannot alone restore lost function. The duty of the doctor to the patient is, in prescribing, to specify drugs the purity of which he can vouch for.

A physician with life dependent upon his efforts, equipped with a thorough medical education, with a full appreciation of the case in hand, and who with reliable drugs could effect a cure, often prescribes his remedies with no knowledge of their manufacture, and therefore of their quality.

We invite correspondence from the profession concerning our products, and will afford all information regarding them desired.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,

WASHINGTON, D. C.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

DR. S. E. STRONG, THE SANITARIUM, 90 CIRCULAR ST.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Dr. R. S. Sutton's Private Institution for the Treatment of Surgical Diseases of Women.

PERFECT SANITARY AND ASEPTIC ARRANGEMENTS, and provided with all Modern Conveniences, Address

170 RIDGE AVENUE, ALLEGHENY, PA.

If, On Account of their Superior Quality and high reputation, you entertain a preference for the

PERFECT PILL PREPARATIONS

Of W. H. SCHIEFFELIN & Co., New York, we venture to suggest that, in prescribing, you specify "W. H. S. & Co.," as marked in the following brief, but always seasonable, selections from our lists:

Pil. Phenacetine et Salophen
"W. H. S. & Co."

For Influenza, (La Grippe,) Acute Rheumatism, Neuralgia, Migraine, Pertussis, and all painful febrile conditions. (Pills of 5 grains each, containing 2½ grains each of Phenacetine-Bayer and Salophen; half strength also.)

Pil. Terpin Hydrat
"W. H. S. & Co."

For Coughs, Colds, Catarrh, Bronchitis and all Acute and Chronic Respiratory Maladies. No unpleasant symptoms follow the continuous use of Terpin Hydrat. (Pills of 2 and 5 grains each.)

Pil. Ferri, Quiniae et Strychniae
"W. H. S. & Co."

For the various forms of Asthenia, and especially for slow Convalescence from Acute Maladies. An excellent pill for the Debility following Malaria. (Pills of 2 1-60 grains each.)

Pil. Phenacetine-Bayer
"W. H. S. & Co."

For All Forms of Fever, Pain, Rheumatism and Neuralgia; for Pertussis, and for conditions in which both pain and fever are to be combated. (Pills of 2, 3, 4 and 5 grains each.)

Pil. Aloin, Strychniae et Belladonnae
"W. H. S. & Co."

For Constipation dependent upon Lack of Tone in the Digestive Organs. It is useful also as an Occasional Laxative and well liked by Patients.

Pil. Quiniae, Ferri et Zinci Valerianat
"W. H. S. & Co."

For Nervous Tension, Melancholia, Epilepsy, Hysteria, Delirium Tremens, Dysmenorrhœa, and all Neuroses dependent upon the cares of life. (Pills of 3 grains.)

W. H. Schieffelin & Co., New York.

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

THE WM. S. MERRELL CHEMICAL CO.,

CINCINNATI, O.

SMITH, KLINE & FRENCH CO., PHILADELPHIA.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

Sup't Walnut Lodge, Hartford, Conn.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)"

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

Pil. Sumbul Comp.
(WM. R. WARNER & CO.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Assafœtida . . . 2 gr. | Ac. Arsenious . . 1-30 gr.

"I use this pill for nervous and hysterical women who need building up" This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day.

Pil. Lady Webster.
(WM. R. WARNER & CO.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose los . . . ½ gr.
" Mastic . . ½ gr. | M. ft. one pill.

Lady Webster Dinner Pills. This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner.

Pil. Digestiva.
(WM. R. WARNER & CO.)

A VALUABLE AID TO DIGESTION.

℞ Pepsin Conc't . 1 gr. | Gingerine . . . 1-16 gr.
Pv. Nux. Vom. ¼ gr. | Sulphur . . . . . ½ gr.

IN EACH PILL.

This combination is very useful in relieving various forms of Dyspepsia and Indigestion, and will afford permanent benefit in cases of enfeebled digestion, where the gastric juices are not properly secreted. As a dinner pill, Pil. Digestiva is unequalled, and may be taken in doses of a single pill either before or after eating.

Pil. Antiseptic Comp.
(WM. R. WARNER & CO.)

EACH PILL CONTAINS

Sulphite Soda . . 1 gr. | Powd. Capsicum . 1-10 gr.
Salicylic Acid . . 1 gr. | Concentrated Pepsin 1 gr.
Ext. Nux Vomica ⅛ gr. | Dose—1 to 3 pills.

Pil. Antiseptic Comp. is prescribed with great advantage in cases of Dyspepsia, Indigestion, and Malassimilation of Food. TAKE NO SUBSTITUTES.

7 Reasons why Papoid is Superior to Pepsin

1 *Digestive Power*

"In other words, Papoid possesses the combined powers of the Salivary, Gastric and Pancreatic ferments."
(KILMER—Paper read before New Jersey Pharmaceutical Association.)

2 *Acts Throughout Entire Alimentary Canal*

"An additional advantage of Papoid (in diphtheria) is that it helps Nature to digest whatever food there may be in the alimentary canal." (LOVE, Prof. Clin. Med. and Diseases of Children, Marion Sims Coll. Med., St. Louis.)

3 *Stimulates Natural Digestion*

"Pepsin often relieves a present difficulty; but Papoid, in addition, places the stomach in condition to digest the next meal. It is far better to make the stomach do its own work. Pepsin makes the stomach lazy; Papoid does not." (LARRABEE, Prof. Hospital College of Medicine, Louisville, Ky.)

4 *Acts in Acid, Alkaline, or Neutral Media*

"But much more convenient than this will be found the dusting of a minute portion of Papoid beneath the protective strips. This succeeds well, because Papoid acts best in a concentrated medium of any reaction whatever, pepsin only in a dilute acid solution." (MORTON, on Leg Ulcers. read before Philadelphia County Medical Society.)

5 *Acts on All Kinds of Food. Can be Combined with Antiseptics*

"The physiological actions of Papoid as a digestive agent have been thoroughly established. It acts upon albuminoids, hydrating them and converting them into peptones. Converts starch with great promptness, the ultimate product being maltose. It emulsifies fats. An important point is, it can be given in conjunction with true antiseptics, even corrosive sublimate in dilute solutions does not interfere with its digestive powers."
(WOODBURY, Prof. Clinical Medicine, Medico-Chirurgical College, Philadelphia, Pa.)

6 *Acts in the Intestines*

"I have accomplished more with Papoid than I was ever able to accomplish with the best pepsin. Papoid does especially well in gastro-intestinal catarrh and colitis." (DIXON, Prest. Kentucky State Medical Society.)

7 *Costs Less*

AVERAGE DOSE PEPSIN IS ABOUT 5 GRAINS AND COSTS 0.0143.
" " PAPOID BEING 1 GRAIN AND COSTS 0.0125.

JOHNSON & JOHNSON CHEMISTS N. Y.

DR. WM. A. HAMMOND'S PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cablecars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

HOSPITAL, 14TH ST. AND SHERIDAN AVE., WASHINGTON, D.C.

UNIVERSITY OF VIRGINIA

JAMES L. CABELL, A. M., M. D., LL. D., *Professor of Physiology and Surgery in the Medical Department of the University of Virginia; President of the National Board of Health, etc., etc.,* says:—

"**The Buffalo Lithia Water** Spring, No. 2, contains in notable quantities two of the alkalies which are accredited as extremely valuable in the treatment of Gout, Lithiasis and Liver Affections. I refer to the Carbonates of Potash and Lithia. It is now well known that both of these alkaline carbonates have an ascertained value in cases of

URIC ACID DIATHESIS CONNECTED WITH GRAVEL

and in cases of Chronic Gout, because of their affinity for Uric Acid and the great solubility of the salts which are formed by their union with that acid. It is, however, held by eminent medical authorities, that 'the beneficial effects of alkalies are not due to their neutralizing acidity, or to any direct action upon Uric Acid,' but that they 'seem to do good by combating the pathological state on which the formation of Uric Acid depends.' We are not, however, left to theory, as to the action of this water, as numerous testimonials from the profession seem to have established the fact that it has already accomplished results, such as its composition would indicate. It is

a remedy of decided efficiency in the Lithaemic condition."

Water in cases of one dozen half-gallon bottles, $5.00, f. o. b. here. For sale by all first-class druggists.

THOMAS F. GOODE, PROPRIETOR
BUFFALO LITHIA SPRINGS, VA.

Dr. J. FEHR'S

"COMPOUND TALCUM" * * * * "BABY POWDER,"

THE

"HYGIENIC DERMAL POWDER"

FOR

INFANTS AND ADULTS.

"Originally investigated and its therapeutic properties discovered in the year 1868, by Dr. Fehr, and introduced to the medical and the pharmaceutical professions in the year 1873."

COMPOSITION:—Silicate of Magnesia with Carbolic and Salicylic Acids.

PROPERTIES:—Antiseptic, Antizymotic, and Disinfectant.

Useful as a **GENERAL SPRINKLING POWDER,** with positive Hygienic, Prophylactic, and Therapeutic properties.

GOOD IN ALL AFFECTIONS OF THE SKIN.

PER DOZ., PLAIN, $1.75; PERFUMED, $3.50.

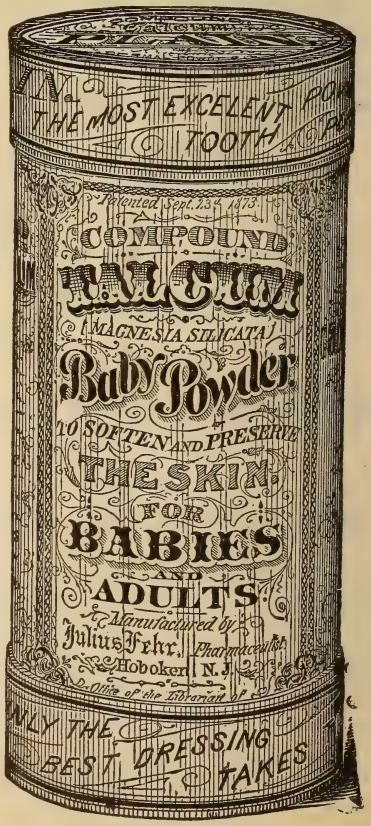
SOLD BY THE DRUG TRADE GENERALLY

MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, HOBOKEN, N. J.

Only advertised in Medical and Pharmaceutical prints.



The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

The Greatest Invention of the Age!

HEAT OR COLD AT WILL. COMFORT SUMMER AND WINTER.
A DEMONSTRATED SUCCESS.

≋ HEALTH ≋ ECONOMY ≋ COMFORT ≋

THE

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

McARTHUR'S SYRUP

[Syr. Hypophos. Comp , C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of poly-pharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

A *Reconstructive* and *Tonic* for *Convalescents.*

Physicians are sending us testimonials, daily, of the excellence of *McArthur's Syrup* as a chemical preparation, a prophylactic or a therapeutic.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., and W. F. WAUGH, M. D., of Philadelphia, and many more Eminent Physicians.

For successful Hypophosphite treatment prescribe thus: Syr. Hypophos. Comp., C. P. McArthur.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. It contains many testimonials.

McARTHUR HYPOPHOSPHITE CO.

Upon receipt of twenty cents in stamps, we will mail to anyone our Standard Diary for 1893, containing Calendar, Obstetric Reaty Reckoner, Antidotes for Poisons, Important Incompatibles, Disinfectants, Weights and Measures, average and maximum doses of Drugs and a Standard Diary with blank pages for memoranda.

McARTHUR HYPOPHOSPHITE CO., Boston, Mass.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

DEAR DOCTOR:

I have met you before and trust you remember me pleasantly. I am doing my best to prove worthy the confidence you impose in me. If you have a bad case of Rheumatism, Gout, Gravel, or any form of Uric Acid poisoning, send for me. I am not a cure all, but I know how to assist you in getting these poisons out of the system. I adopt the "American idea" so that I may not be mixed up with my foreign rivals. American products for Americans is the popular sentiment. If you wish to know who my friends are, send me word. I have a list of the most eminent physicians in the world who are always glad to say a kind word for me. If you doubt my ability to control disease, I will do my best to convince you without charge. My offices are:

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

THE APOLLINARIS COMPANY, LD., LONDON

SEASONABLE SPECIALTIES

We have pleasure in announcing a most eligible Pill formula entitled CHALYBEATE COMPOUND IMPROVED (Jarvis): Iron Sulph. Exsic., 1½ grs.; Potass. Carbonate, 1½ grs.; Ext. Nux Vomica, $\frac{1}{10}$ gr.

As Cardiac Tonics and Hæmatinics, Iron and Nux Vomica are resorted to more often than any other drugs. According to Lauder Brunton, the alkaloid of Nux Vomica—Strychnia—is one of the best gastric tonics in dyspepsia where there is a tendency to catarrh and congestion, It prevents frontal headache, is an appetizer, a respiratory stimulant, relieves the night sweats of phthisis, serves admirably in mental overwork, sexual debility, hysteria and chorea, and in many forms of paralysis, including the infantile variety.

A MODERN METHOD OF MEDICATION.

Among the many methods of administering medicaments, the Soluble Elastic Gelatin Capsule is growing to be one of the most favored.

Few physicians are aware of the many medicaments that are now administered in this way. Among these one need only mention the following to indicate the wide application of this method of giving numerous drugs:

Apiol; Balsam Fir; Balsam Peru; Cascara Sagrada; Castor Oil and Podophyllin; Chaulmoogra Oil; Cod-Liver Oil and Iodine; Cod-Liver Oil and Iodoform; Cod-Liver Oil and Iron; Cod-Liver Oil and Phosphorus; Copaiba; Copaiba and Cubeb; Copaiba, Cubeb, and Buchu; Copaiba, Cubeb, and Iron; Copaiba, Cubeb, and Matico; Copaiba, Cubeb, Matico, and Sandal; Copaiba, Cubeb, and Sandal; Copaiba, Cubeb, and Sarsaparilla; Copaiba and Iron; Copaiba, Cubeb, and Turpentine; Copaiba and Sandal; Creasote (beechwood), 1 minim; Eucalyptus Oil; Gurjun Balsam; Linseed Oil; Liquor Sedans; Male Fern and Kamala; Nytroglycerin, 1-100 grain; Oil of Pennyroyal; Pichi Extract; Salol; Tar, purified; Valerian Oil; Warburg's Tincture; Wintergreen Oil; Wormseed Oil; Quinine Muriate and Sulphate.

ANTISEPTICS AND DISINFECTANTS.

The prevention of disease is the unselfish mission of the modern physician. Antiseptics and Disinfectants to-day occupy the first place in medical and surgical practice.

We desire to call attention to the following Antiseptic and Disinfectant preparations:

Antiseptic Liquid arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be used in cellars, barns, out-houses, and the sick-room.

Antiseptic Tablets are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

Eucalyptus and Thymol Antiseptic is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited.

Sulphur Candles thoroughly employed are effectual in the fumigation and disinfecting of rooms after infectious diseases.

Correspondence regarding any of our pure and accurate preparations of standard pharmaceuticals and specialties solicited.

PARKE, DAVIS & CO.,

DETROIT, NEW YORK, KANSAS CITY, AND WALKERVILLE, ONT.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails. A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc. THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

ESTABLISHED 1848 INCORPORATED 1893

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)."

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

J. ARTHUR JACKSON, SECRETARY, DANSVILLE, NEW YORK.

Calculi Dissolved

BY THE

Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

Dr. John Herbert Claiborne, of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.

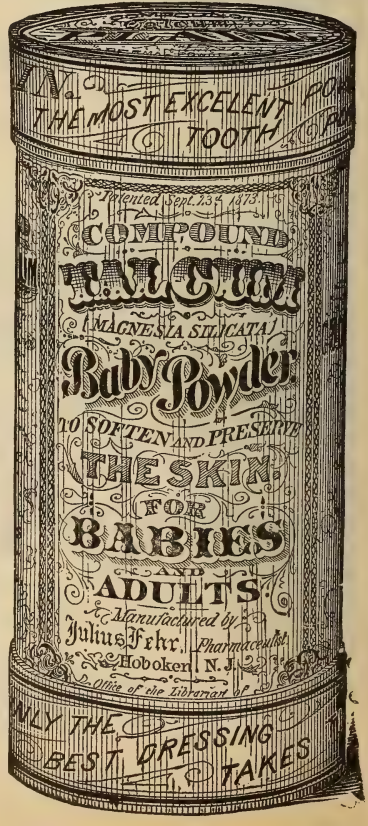
MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, HOBOKEN, N. J.

Only advertised in Medical and Pharmaceutical prints.



The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

Manufactured only by

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:		Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.
Pure Cod Liver Oil.....80 m. (drops)	Soda.....1-3 Grains.	
Distilled Water.....35 "	Salicylic Acid.....1-4 "	
Soluble Pancreatin..... 5 Grains.		

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

Health Restorative Company

90 South Fifth Avenue, New York

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

DEAR DOCTOR:

I have met you before and trust you remember me pleasantly. I am doing my best to prove worthy the confidence you impose in me. If you have a bad case of Rheumatism, Gout, Gravel, or any form of Uric Acid poisoning, send for me. I am not a cure all, but I know how to assist you in getting these poisons out of the system. I adopt the "American idea" so that I may not be mixed up with my foreign rivals. American products for Americans is the popular sentiment. If you wish to know who my friends are, send me word. I have a list of the most eminent physicians in the world who are always glad to say a kind word for me. If you doubt my ability to control disease, I will do my best to convince you without charge. My offices are:

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

A NEW DEPARTURE
IN THERAPEUTICS.

Physiological Remedies: Desiccated Thyroids, Cerebrin.

As a result of the well-known investigation of Dr. Brown-Sequard and other eminent therapeutists, materia medica has recently been largely extended by resort to the use of products representative of certain glands or tissues of the animal economy.

As we have always made the manufacture of the digestive ferments a specialty, and enjoy every facility for the preparation of products of this character, we will undertake to supply some of these new remedies, of which we now have ready:

DESICCATED THYROIDS

In the form of an impalpable powder, representing in permanent form the thyroid glands of sheep. This product is of such strength that 15 grains represent one gland of average size. It is highly recommended in the treatment of Myxœdema.

CEREBRIN,

Prepared after the formula of Dr. William A. Hammond. Put up in glass-stoppered ounce vials.

[While Dr. Hammond has recommended maceration of the brains for six months, we have modified his method in such manner that we are enabled to thoroughly extract the crude material in as many days.]

One serious drawback to the use of these products has been the difficulty in getting the necessary crude material, and the disagreeable character of the work involved in their preparation.

Again, it is only by the most scrupulous attention to the minutest details that asepsis in the finished article can be secured and assured.

The well-known reputation of our house is a guarantee of our ability and intention to fulfill every requisite. We do not doubt that many interesting results will follow the application of these new physiological remedies.

It is our purpose to extend this list from time to time. Descriptive literature of those announced will be supplied on application.

PARKE, DAVIS & CO.,

DETROIT, NEW YORK, KANSAS CITY, AND WALKERVILLE, ONT.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

CALIFORNIA FIG SYRUP COMPANY

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)."

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

Calculi Dissolved

BY THE

Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

Dr. John Herbert Claiborne, of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

Bedford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

ESTABLISHED 16 YEARS. BEWARE OF IMITATIONS.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1;"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention *"COLDEN'S,"* viz., *"Ext. Carnis Fl. Comp. (Colden)."* A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

C. N. CRITTENTON, General Agent, 115 Fulton St., New York.

GLENN'S SULPHUR SOAP.

BEWARE OF COUNTERFEITS.

Physicians know the great value of the local use of Sulphur in the **Treatment of Diseases of the Skin.**

Constantine's Pine-Tar Soap.

THE BEST SOAP MADE.

Has been on trial among physicians for very many years as a healing agent. **By far the Best Tar Soap made.**

Wholesale Depot, C. N. CRITTENTON, 115 Fulton St., New York.

Samples of above Soaps SENT FREE, on application, to any Physician enclosing card.

SOLD BY LEADING DRUGGISTS.

Laboratory, 28 Prince St., New York.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

THEODORE METCALF CO.

39 Tremont Street, Boston, Mass.

Established 1837

McARTHUR'S SYRUP

[Syr. Hypophos. Comp., C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of poly-pharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

A *Reconstructive* and *Tonic* for *Convalescents*.

Physicians are sending us testimonials, daily, of the excellence of *McArthur's Syrup* as a chemical preparation, a prophylactic or a therapeutic.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., and W. F, WAUGH, M. D., of Philadelphia, and many more Eminent Physicians.

For successful Hypophosphite treatment prescribe thus: Syr. Hypophos. Comp., C. P. McArthur.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. It contains many testimonials.

McARTHUR HYPOPHOSPHITE CO.

Upon receipt of twenty cents in stamps, we will mail to anyone our Standard Diary for 1893, containing Calendar, Obstetric Ready Reckoner, Antidotes for Poisons, Important Incompatibles, Disinfectants, Weights and Measures, average and maximum doses of Drugs and a Standard Diary with blank pages for memoranda.

McARTHUR HYPOPHOSPHITE CO., Boston, Mass.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.
Per case of half-dozen Bottles, - $6.00
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M. D., Professor of Physiology.
WILLIAM F. NORRIS, M. D., Professor of Ophthalmology.
BARTON COOKE HIRST, M. D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to
DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:

NEW YORK.

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

An "Ideal Disinfectant" and Antiseptic.

Lysol

TRADE MARK.

Put up in One Pound Bottles.
(1 pound furnishes 12 gallons of a 1% solution.)

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

Health Restorative Company

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

CHARLES GRAEF & CO.,
32 Beaver Street, New York,

Sole Agents in the United States and Canada of

THE APOLLINARIS COMPANY, LD., LONDON

SEASONABLE SPECIALTIES

We have pleasure in announcing a most eligible Pill formula entitled CHALYBEATE COMPOUND IMPROVED (Jarvis): Iron Sulph. Exsic., 1½ grs.; Potass. Carbonate, 1½ grs.; Ext. Nux Vomica, $\frac{1}{10}$ gr.

As Cardiac Tonics and Hæmatinics, Iron and Nux Vomica are resorted to more often than any other drugs. According to Lauder Brunton, the alkaloid of Nux Vomica—Strychnia—is one of the best gastric tonics in dyspepsia where there is a tendency to catarrh and congestion, It prevents frontal headache, is an appetizer, a respiratory stimulant, relieves the night sweats of phthisis, serves admirably in mental overwork, sexual debility, hysteria and chorea, and in many forms of paralysis, including the infantile variety.

A MODERN METHOD OF MEDICATION.

Among the many methods of administering medicaments, the Soluble Elastic Gelatin Capsule is growing to be one of the most favored.

Few physicians are aware of the many medicaments that are now administered in this way. Among these one need only mention the following to indicate the wide application of this method of giving numerous drugs:

Apiol; Balsam Fir; Balsam Peru; Cascara Sagrada; Castor Oil and Podophyllin; Chaulmoogra Oil; Cod-Liver Oil and Iodine; Cod-Liver Oil and Iodoform; Cod-Liver Oil and Iron; Cod-Liver Oil and Phosphorus; Copaiba; Copaiba and Cubeb; Copaiba, Cubeb, and Buchu; Copaiba, Cubeb, and Iron; Copaiba, Cubeb, and Matico; Copaiba, Cubeb, Matico, and Sandal; Copaiba, Cubeb, and Sandal; Copaiba, Cubeb, and Sarsaparilla; Copaiba and Iron; Copaiba, Cubeb, and Turpentine; Copaiba and Sandal; Creasote (beechwood), 1 minim; Eucalyptus Oil; Gurjun Balsam; Linseed Oil; Liquor Sedans; Male Fern and Kamala; Nytroglycerin, 1-100 grain; Oil of Pennyroyal; Pichi Extract; Salol; Tar, purified; Valerian Oil; Warburg's Tincture; Wintergreen Oil; Wormseed Oil; Quinine Muriate and Sulphate.

ANTISEPTICS AND DISINFECTANTS.

The prevention of disease is the unselfish mission of the modern physician. Antiseptics and Disinfectants to-day occupy the first place in medical and surgical practice.

We desire to call attention to the following Antiseptic and Disinfectant preparations:

Antiseptic Liquid arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be used in cellars, barns, out-houses, and the sick-room.

Antiseptic Tablets are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

Eucalyptus and Thymol Antiseptic is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited.

Sulphur Candles thoroughly employed are effectual in the fumigation and disinfecting of rooms after infectious diseases.

Correspondence regarding any of our pure and accurate preparations of standard pharmaceuticals and specialties solicited.

PARKE, DAVIS & CO.,

DETROIT, NEW YORK, KANSAS CITY, AND WALKERVILLE, ONT.

ESTABLISHED 1855.

DR. STRONG'S SANITARIUM,

SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed.

For Treatment: In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

For Change: This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

For Rest: The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

For Recreation: To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

National Heating AND Ventilating Company

OPERATING

THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails. A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

Bedford Springs

Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

THEODORE METCALF CO.

39 Tremont Street, Boston, Mass.

Established 1837

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

Mr. FELLOWS, 48 Vesey Street, New York.

MILK OF MAGNESIA.

A PURE HYDRATED OXIDE OF MAGNESIUM.—(MgH_2O_2.)

ANTACID.

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach.

PHOSPHO-MURIATE OF QUININE,

COMPOUND.

A RELIABLE ALTERATO-CONSTRUCTIVE.

Practically applicable to conditions of MAL-NUTRITION.

A reliable TONIC in CONVALESCENCE from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in GLANDULAR ENLARGEMENTS, SCROFULOSIS, IMPERFECT BONE FORMATION, or IMPAIRMENT OF THE CENTRAL NERVOUS SYSTEM. An easily appropriated and stable combination of the Soluble WHEAT PHOSPHATES with MURIATE of QUININE, IRON and STRYCHNIA.

Of greater strength than the various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers.

DIGESTIBLE COCOA.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M. D., LL. D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M. D., Professor of Gynæcology.
JAMES TYSON, M. D., Professor of Clinical Medicine.
HORATIO C. WOOD, M. D., LL. D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)."

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

DÉVIATION DES RÉGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

DEAR DOCTOR:

I have met you before and trust you remember me pleasantly. I am doing my best to prove worthy the confidence you impose in me. If you have a bad case of Rheumatism, Gout, Gravel, or any form of Uric Acid poisoning, send for me. I am not a cure all, but I know how to assist you in getting these poisons out of the system. I adopt the "American idea" so that I may not be mixed up with my foreign rivals. American products for Americans is the popular sentiment. If you wish to know who my friends are, send me word. I have a list of the most eminent physicians in the world who are always glad to say a kind word for me. If you doubt my ability to control disease, I will do my best to convince you without charge. My offices are:

NERVOUS EXHAUSTION

HORSFORD'S ACID PHOSPHATE.

Recommended as a restorative in all cases where the nervous system has been reduced below the normal standard, by overwork, as found in brain-workers, professional men, teachers, students, etc., in debility from seminal losses, dyspepsia of nervous origin, insomnia where the nervous system suffers.

It is readily assimilated and promotes digestion.

Dr. Edwin F. Vose, Portland, Me., says: "I have prescribed it for many of the various forms of nervous debility, and it has never failed to do good."

Send for descriptive circular. Physicians who wish to test it will be furnished, upon application, with a sample, by mail, or a full size bottle without expense, except express charges.

Prepared under the direction of Prof. E. N. HORSFORD, by the

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

Raw Material Degenerates In Transportation

Pepsin does not. Delay in utilizing material means diseased tissue. Our Pepsin is made where the Hogs are killed—thus no delay and no putrefaction. Let us send you a sample.

From about 2,500,000 Stomachs received yearly, we produce 30,000 pounds of Pepsin, over 15,000 pounds being sold under contracts to manufacturers, 5,000 pounds used by us for Essence, Tablets, etc., 10,000 pounds reserved for the retail trade.

Calculi Dissolved

BY THE

Buffalo Lithia Water

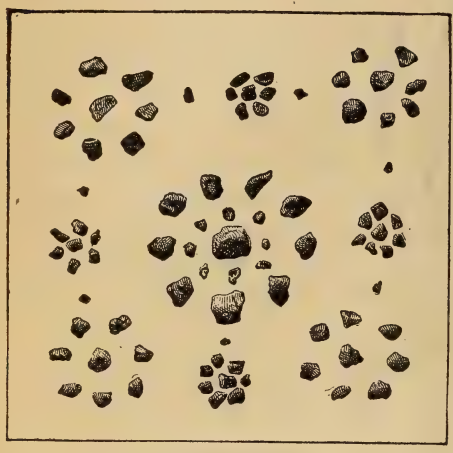

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calcuii; they are four times size of above.

Dr. John Herbert Claiborne, of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.

1512 CHESTNUT STREET PHILADELPHIA

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

DR. WM. A. HAMMOND'S
PRIVATE HOSPITAL
FOR
DISEASES
OF THE
NERVOUS SYSTEM
WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cablecars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

HOSPITAL, 14TH ST. AND SHERIDAN AVE., WASHINGTON, D.C.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

Bedford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

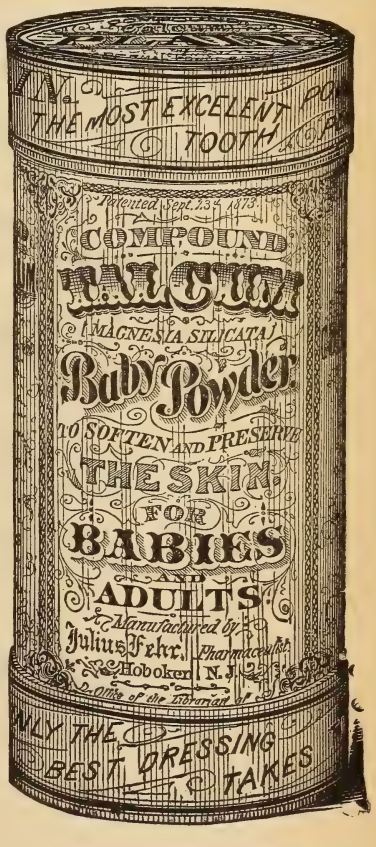
MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, HOBOKEN, N. J.

Only advertised in Medical and Pharmaceutical prints.



Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil.....80 m. (drops)		Soda.....1-3 Grains.	
Distilled Water.....35 "		Salicylic Acid.....1-4 "	
Soluble Pancreatin..... 5 Grains.			

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which HYDROLEINE is indicated:

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable,—supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, $6.00.
Per case of One Dozen Bottles, 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 127TH ANNUAL WINTER SESSION will begin Monday, Oct. 3d, 1892, at 12 M., and continue 7 months.
THE PRELIMINARY SESSION has been discontinued; the Spring Term begins early in May, 1893.
The curriculum is graded and three annual winter sessions are required. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology; with bedside instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.
☞With the session beginning October 2, 1893, a four-year compulsory course will be instituted.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine, and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and General Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITERAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat. Sc. D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D., Professor of Hygiene.

For Catalogue and announcement containing particulars, apply to

DR. JOHN MARSHALL, Dean,
36th and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY

Horace Tracy Hanks, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

PARTURITION.

Aletris Cordial (Rio), given in Teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial. It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial in the proportions above stated.

OUR PROPOSITION

DO YOU CARE TO CONSIDER IT?

Or do you prefer to grope along in the darkness, losing valuable time and wasting golden opportunities?

Never mind what the great Doctor Blank says of LONDONDERRY. You wish to establish your own opinions.

HOW? READ CAREFULLY!

We will furnish water free and pay all costs of chemical analysis of the urine for any clinical test, independently or in comparison with any water, natural or artificial, or any drug used as an anti-lithic!

We Claim that LONDONDERRY LITHIA will cure more cases of Rheumatism than any other water or any drug and stand ready for the test.

"HUNYADI" WATERS.

Paragraphs have recently appeared in some Newspapers here stating that a New York firm of mineral water dealers are the lessees in America of the Hunyadi Waters of Buda Pest, and respectively sole agents in the United States for the famous Hunyadi Springs of Hungary.

These statements are ABSOLUTELY false, and the intention with which they are made is obvious.

Before any Hunyadi Water was practically known in the United States, The Apollinaris Company, Limited, of London, widely and successfully introduced the Hunyadi Janos Water, the Proprietor in Buda Pest of the Springs having entrusted to them, for a term of years still unexpired, the sole sale of this water in England and all transmarine places. Hunyadi Janos water having become very popular, quite a number of other Waters are now offered for sale, under names, of which the word Hunyadi forms part, and in bottles, and with labels, closely resembling in appearance and color those long used for Hunyadi Janos Water.

The word "Hunyadi" having become a generic name for Hungarian Bitter Waters, good, bad or indifferent, The Apollinaris Company affixed to the bottles of Hunyadi Janos, the Hungarian Bitter Water of which they have still the sole sale, a small Yellow Label with their Red Diamond, the object of this Trade Mark being ONLY to indicate to the Public that the bottle so labelled is sold by The Apollinaris Company, Limited.

Consumers, who desire to secure the Hungarian Bitter Water sold by The Apollinaris Company, are requested to see that the bottle bears the Red Diamond and they are cautioned against such absolutely false statements as those contradicted herein.

Sole Agents in the United States and Canada of

THE APOLLINARIS COMPANY, LD., LONDON

SEASONABLE SPECIALTIES

We have pleasure in announcing a most eligible Pill formula entitled CHALYBEATE COMPOUND IMPROVED (Jarvis): Iron Sulph. Exsic., 1½ grs.; Potass. Carbonate, 1½ grs.; Ext. Nux Vomica, $\frac{1}{10}$ gr.

As Cardiac Tonics and Hæmatinics, Iron and Nux Vomica are resorted to more often than any other drugs. According to Lauder Brunton, the alkaloid of Nux Vomica—Strychnia—is one of the best gastric tonics in dyspepsia where there is a tendency to catarrh and congestion, It prevents frontal headache, is an appetizer, a respiratory stimulant, relieves the night sweats of phthisis, serves admirably in mental overwork, sexual debility, hysteria and chorea, and in many forms of paralysis, including the infantile variety.

A MODERN METHOD OF MEDICATION.

Among the many methods of administering medicaments, the Soluble Elastic Gelatin Capsule is growing to be one of the most favored.

Few physicians are aware of the many medicaments that are now administered in this way. Among these one need only mention the following to indicate the wide application of this method of giving numerous drugs:

Apiol; Balsam Fir; Balsam Peru; Cascara Sagrada; Castor Oil and Podophyllin; Chaulmoogra Oil; Cod-Liver Oil and Iodine; Cod-Liver Oil and Iodoform; Cod-Liver Oil and Iron; Cod Liver Oil and Phosphorus; Copaiba; Copaiba and Cubeb; Copaiba, Cubeb, and Buchu; Copaiba, Cubeb, and Iron; Copaiba, Cubeb, and Matico; Copaiba, Cubeb, Matico, and Sandal; Copaiba, Cubeb, and Sandal; Copaiba, Cubeb, and Sarsaparilla; Copaiba and Iron; Copaiba, Cubeb, and Turpentine; Copaiba and Sandal; Creasote (beechwood), 1 minim; Eucalyptus Oil; Gurjun Balsam; Linseed Oil; Liquor Sedans; Male Fern and Kamala; Nytroglycerin, 1-100 grain; Oil of Pennyroyal; Pichi Extract; Salol; Tar, purified; Valerian Oil; Warburg's Tincture; Wintergreen Oil; Wormseed Oil; Quinine Muriate and Sulphate.

ANTISEPTICS AND DISINFECTANTS.

The prevention of disease is the unselfish mission of the modern physician. Antiseptics and Disinfectants to-day occupy the first place in medical and surgical practice.

We desire to call attention to the following Antiseptic and Disinfectant preparations:

Antiseptic Liquid arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be used in cellars, barns, out-houses, and the sick-room.

Antiseptic Tablets are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

Eucalyptus and Thymol Antiseptic is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited.

Sulphur Candles thoroughly employed are effectual in the fumigation and disinfecting of rooms after infectious diseases.

Correspondence regarding any of our pure and accurate preparations of standard pharmaceuticals and specialties solicited.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use, because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, Metcalf's Coca Wine acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

Bedford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

EUROPHEN

SUBSTITUTE FOR IODOFORM.

As an antiseptic dressing and cicatrisant in minor and general surgery, and as an eligible application for ulcerative or catarrhal conditions of the membranous tissues, Europhen, or isobutylorthocresoliodide, heads the list of topical remedies. In lesions of a specific character, whether of recent origin or of long standing, Europhen gives prompt and gratifying results. For chronic ulcers of the leg, fistulæ and burns, Europhen is an unrivalled application; and it may be advantageously employed in all cavital troubles ordinarily treated by iodoform, or the antiseptics. Europhen has an agreeable odor; it covers five times more surface than iodoform; and it adheres firmly to lesions to which it is applied. Supplied in ounces.

NOTE THE FOLLOWINC.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 128TH ANNUAL WINTER SESSION will begin Monday, Oct. 2d, 1893, at 12 M., and will end at Commencement, June 5th, 1894
THE PRELIMINARY AND SPRING SESSIONS have been discontinued.
The curriculum is graded and attendance upon four annual winter sessions is required. College GRADUATES in Arts or Science, who have pursued certain Biological studies, are admitted to advanced standing. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology, with Bedside Instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M D., LL.D., Professor of Materia Medica, Pharmacy and Gen'l Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITÉRAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat Sc.D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D, Professor of Hygiene.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)."

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

Sole Agents in U. S. LEHN & FINK, NEW YORK.

ANNOUNCEMENT!

The Animal Extracts ---perfectly sterilized ---prepared according to Dr. Wm. A. Hammond's formulæ, in his laboratory at Washington, D.C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

Cerebrine *from the brain, for diseases of the brain;*
Medulline *from the spinal cord, for diseases of the cord;*
Cardine *from the heart, for diseases of the heart,*
Testine *from the testes, for diseases of the testes,*
Ovarine *from the ovaries, for diseases of the ovaries.*

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and from their liability to decomposition, are dangerous.

All the existing literature on the subject of THE ANIMAL EXTRACTS, made by Dr. Hammond's process and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

THE COLUMBIA CHEMICAL CO.,
90 South Fifth Avenue, New York.

DIABETINE-SCHERING

The only innocuous and palatable sugar for diabetics.

BENZONAPHTHOL-SCHERING

SCHERING'S

FORMALIN

THE NEW HARMLESS GERMICIDE

Has a germicidal action superior to Corrosive Sublimate without its toxicity.

THIS LIQUID MIXES IN ALL PROPORTIONS WITH WATER

At ordinary temperature even, FORMALIN gives off Gaseous, Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. Stahl, Berlioz, and Frillat, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. Stahl's observations that after one hour's exposure to one per mille, or a quarter of an hour's exposure to $1\frac{1}{3}$ per mille solution of FORMALIN, the most resistant forms of micro-organisms were destroyed. FORMALIN, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

FORMALIN may be applied in 1 per cent. solutions, by spray diffusers, without damage to furniture, metal or materials.

FORMALIN is supplied in one pound bottles.

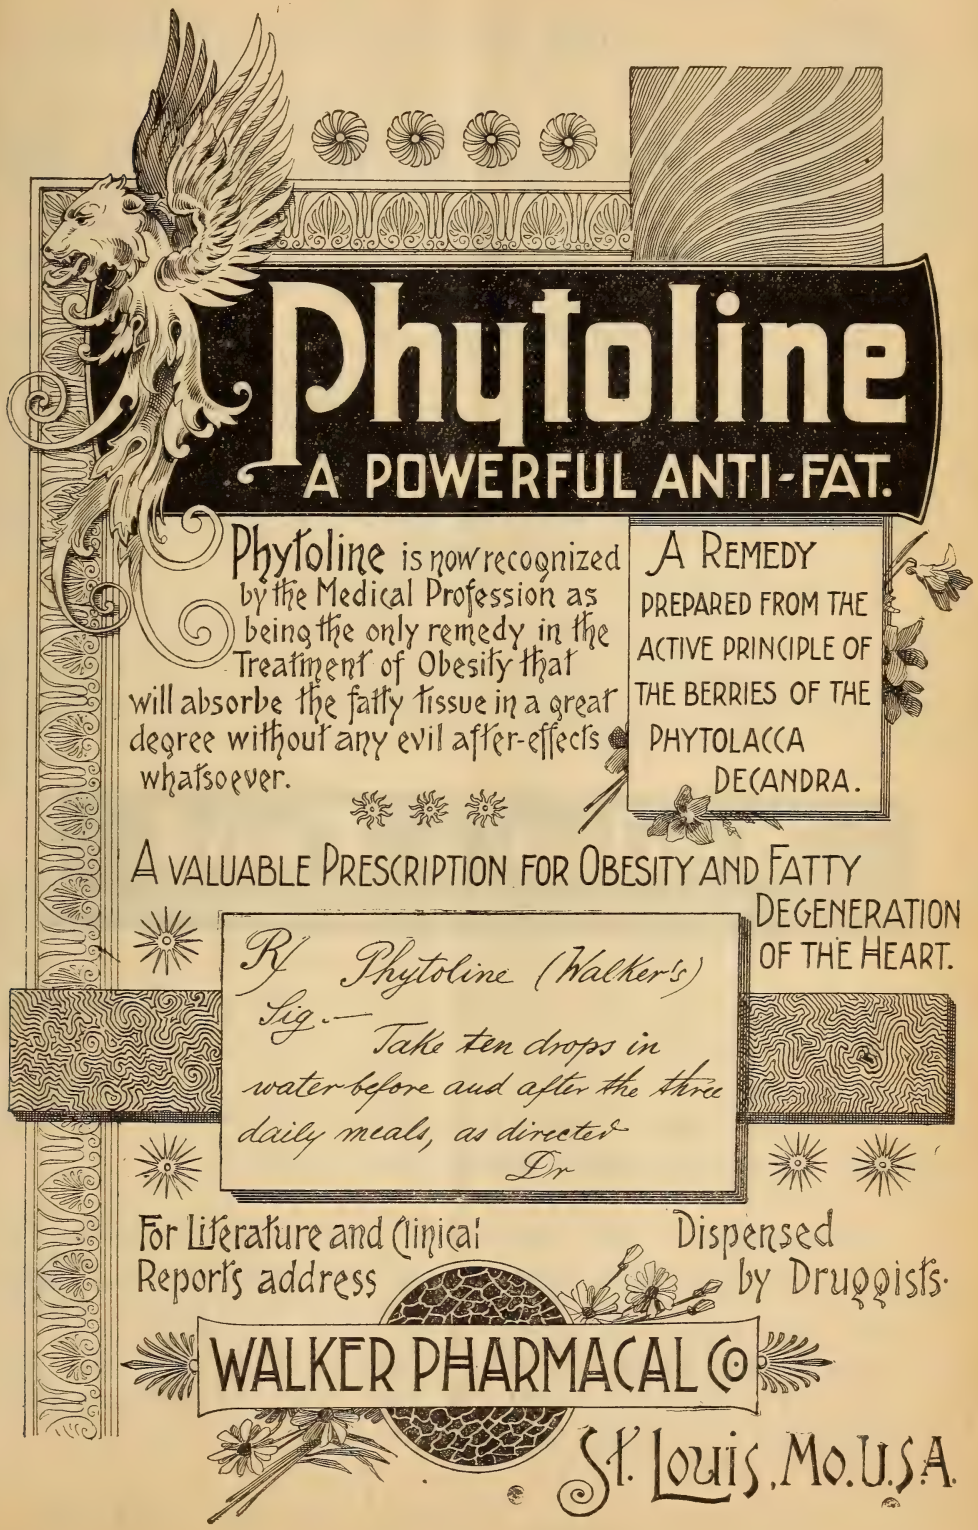
DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.



Phytoline
A POWERFUL ANTI-FAT.

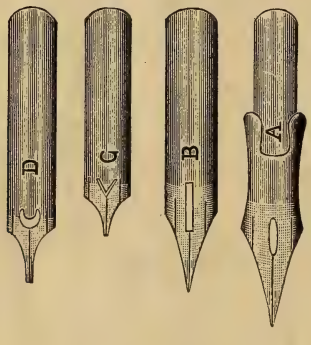
Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

THE DELPAMAS PEN



A SMOOTH PEN FOR RAPID WRITING

THESE Pens are manufactured from the finest metal, and will outlast five ordinary pens. For durability, smoothness of point, uniformity and ease of action, they are superior to all others.

For sale only by

JOHN J. WOOD

Printing and Engraving

1345 Arch St., Philadelphia

PRICE:—75c. per gross; 3 gross for $2.00.
Postage paid.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

DR. WM. A. HAMMOND'S PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cablecars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information DR. HAMMOND can be addressed at the

HOSPITAL, 14TH ST. AND SHERIDAN AVE., WASHINGTON, D.C.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

THEODORE METCALF CO.

Bedford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1;"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention *"COLDEN'S,"* viz., *"Ext. Carnis Fl. Comp. (Colden)."* A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. *Sold by druggists generally.*

Calculi Dissolved

BY THE

Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

Dr. John Herbert Claiborne, of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp , C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of poly-pharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

A *Reconstructive* and *Tonic* for *Convalescents*.

Physicians are sending us testimonials, daily, of the excellence of *McArthur's Syrup* as a chemical preparation, a prophylactic or a therapeutic.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., and W. F, WAUGH, M. D., of Philadelphia, and many more Eminent Physicians.

For successful Hypophosphite treatment prescribe thus: Syr. Hypophos. Comp., C. P. McArthur.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. It contains many testimonials.

McARTHUR HYPOPHOSPHITE CO., Boston, Mass.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00
Per case of One Dozen Bottles, - 12.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 128TH ANNUAL WINTER SESSION will begin Monday, Oct. 2d, 1893, at 12 M., and will end at Commencement, June 5th, 1894
THE PRELIMINARY AND SPRING SESSIONS have been discontinued.
The curriculum is graded and attendance upon four annual winter sessions is required. College GRADUATES in Arts or Science, who have pursued certain Biological studies, are admitted to advanced standing. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology, with Bedside Instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and Gen'l Therapeutics.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:

NEW YORK.

Horace Tracy Hanks, M. D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

THE COLUMBIA CHEMICAL CO.,
90 South Fifth Avenue, New York.

Do You Lose Money?

I MEAN, do you lose sight of old bills? Do you have trouble to prove your claims? and do you fail to get in all your charges because your system of accounts is faulty?

When a patient asks, "How much do I owe you, Doctor?" can you tell him exactly in ten seconds? No? Then you are not using Dr. Walker's "Complete Book of Records," and you need it. Just out; new idea; perfect; cheap. All manner of accounts complete in one book; original entry. You may see sample pages and learn all particulars, at the expense of one postal card, by sending your name and address to Keystone Publishing Co., Philadelphia. Do it to-day.

DIABETINE-SCHERING

The only innocuous and palatable sugar for diabetics.

BENZONAPHTHOL-SCHERING

chemically pure
intestinal antiseptic

SCHERING'S

FORMALIN

THE NEW HARMLESS GERMICIDE

Has a germicidal action superior to Corrosive Sublimate without its toxicity.

THIS LIQUID MIXES IN ALL PROPORTIONS WITH WATER

At ordinary temperature even, FORMALIN gives off Gaseous, Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. Stahl, Berlioz, and Frillat, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. Stahl's observations that after one hour's exposure to one per mille, or a quarter of an hour's exposure to $1\frac{1}{3}$ per mille solution of FORMALIN, the most resistant forms of micro-organisms were destroyed. FORMALIN, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

FORMALIN may be applied in 1 per cent. solutions, by spray diffusers, without damage to furniture, metal or materials.

FORMALIN is supplied in one pound bottles.

CREASOTE-SCHERING

Strictly pure
from Beechwood-Tar

NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

Phytoline

A POWERFUL ANTI-FAT.

Phytoline is now recognized by the Medical Profession as being the only remedy in the Treatment of Obesity that will absorbe the fatty tissue in a great degree without any evil after-effects whatsoever.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF THE PHYTOLACCA DECANDRA.

OUR PROPOSITION

DO YOU CARE TO CONSIDER IT?

Or do you prefer to grope along in the darkness, losing valuable time and wasting golden opportunities?

Never mind what the great Doctor Blank says of LONDONDERRY. You wish to establish your own opinions.

HOW? READ CAREFULLY!

We will furnish water free and pay all costs of chemical analysis of the urine for any clinical test, independently or in comparison with any water, natural or artificial, or any drug used as an anti-lithic!

We Claim that LONDONDERRY LITHIA will cure more cases of Rheumatism than any other water or any drug and stand ready for the test.

SEASONABLE SPECIALTIES

We have pleasure in announcing a most eligible Pill formula entitled CHALYBEATE COMPOUND IMPROVED (Jarvis): Iron Sulph. Exsic., 1½ grs.; Potass. Carbonate, 1½ grs.; Ext. Nux Vomica, $\frac{1}{16}$ gr.

As Cardiac Tonics and Hæmatinics, Iron and Nux Vomica are resorted to more often than any other drugs. According to Lauder Brunton, the alkaloid of Nux Vomica—Strychnia—is one of the best gastric tonics in dyspepsia where there is a tendency to catarrh and congestion, It prevents frontal headache. is an appetizer, a respiratory stimulant, relieves the night sweats of phthisis, serves admirably in mental overwork, sexual debility, hysteria and chorea, and in many forms of paralysis, including the infantile variety.

A MODERN METHOD OF MEDICATION.

Among the many methods of administering medicaments, the Soluble Elastic Gelatin Capsule is growing to be one of the most favored.

Few physicians are aware of the many medicaments that are now administered in this way. Among these one need only mention the following to indicate the wide application of this method of giving numerous drugs:

Apiol; Balsam Fir; Balsam Peru; Cascara Sagrada; Castor Oil and Podophyllin; Chaulmoogra Oil; Cod-Liver Oil and Iodine; Cod-Liver Oil and Iodoform; Cod-Liver Oil and Iron; Cod-Liver Oil and Phosphorus; Copaiba; Copaiba and Cubeb; Copaiba, Cubeb, and Buchu; Copaiba, Cubeb, and Iron; Copaiba, Cubeb, and Matico; Copaiba, Cubeb, Matico, and Sandal; Copaiba, Cubeb, and Sandal; Copaiba, Cubeb, and Sarsaparilla; Copaiba and Iron; Copaiba, Cubeb, and Turpentine; Copaiba and Sandal; Creasote (beechwood), 1 minim; Eucalyptus Oil; Gurjun Balsam; Linseed Oil; Liquor Sedans; Male Fern and Kamala; Nytroglycerin, 1-100 grain; Oil of Pennyroyal; Pichi Extract; Salol; Tar, purified; Valerian Oil; Warburg's Tincture; Wintergreen Oil; Wormseed Oil; Quinine Muriate and Sulphate.

ANTISEPTICS AND DISINFECTANTS.

The prevention of disease is the unselfish mission of the modern physician. Antiseptics and Disinfectants to-day occupy the first place in medical and surgical practice.

We desire to call attention to the following Antiseptic and Disinfectant preparations:

Antiseptic Liquid arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be used in cellars, barns, out-houses, and the sick-room.

Antiseptic Tablets are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

Eucalyptus and Thymol Antiseptic is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited.

Sulphur Candles thoroughly employed are effectual in the fumigation and disinfecting of rooms after infectious diseases.

Correspondence regarding any of our pure and accurate preparations of standard pharmaceuticals and specialties solicited.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

Beaford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

Factory, Office and Laboratory

267 W. Seventeenth St., New York

Specify Tilden's

Fluid Extract **ERGOT** Formula of 1874

The superiority of this preparation **over all others** consists in the fact that our Ergot is manufactured by a process unknown to any other maker, whereby certain undesirable qualities are eliminated, and because

1. **It is positively uniform in strength and action.**
2. **It does not nauseate.**
3. **It can be used hypodermically without causing inflammation of cellular tissue or abscess.**
4. **The dose required is smaller.**

HYPODERMIC DOSE: Five to fifteen drops diluted with water. Samples furnished upon application.

Prepared only by

Established 1848 **THE TILDEN CO.** Incorporated 1893

SYR. HYPOPHOS. CO., FELLOWS

Contains the Essential Elements of the Animal Organization—Potash and Lime;

The Oxidizing Agents—Iron and Manganese;

The Tonics—Quinine and Strychnine;

And the Vitalizing Constituent—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

It Differs in its Effects from all Analogous Preparations; and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

It has Gained a Wide Reputation, particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

Its Curative Power is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

Its Action is Prompt; it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

Medical Letters may be addressed to:

Mr. FELLOWS, 48 Vesey Street, New York.

MILK OF MAGNESIA.

A PURE HYDRATED OXIDE OF MAGNESIUM.—(MgH_2O_2.)

ANTACID.

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach.

PHOSPHO-MURIATE OF QUININE,

COMPOUND.

A RELIABLE ALTERATO-CONSTRUCTIVE.

Practically applicable to conditions of MAL-NUTRITION.

A reliable TONIC in CONVALESCENCE from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in GLANDULAR ENLARGEMENTS, SCROFULOSIS, IMPERFECT BONE FORMATION, or IMPAIRMENT OF THE CENTRAL NERVOUS SYSTEM. An easily appropriated and stable combination of the Soluble WHEAT PHOSPHATES with MURIATE of QUININE, IRON and STRYCHNIA.

Of greater strength than the various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers.

DIGESTIBLE COCOA.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 128TH ANNUAL WINTER SESSION will begin Monday, Oct. 2d, 1893, at 12 M., and will end at Commencement, June 5th, 1894 THE PRELIMINARY AND SPRING SESSIONS have been discontinued.

The curriculum is graded and attendance upon four annual winter sessions is required. College GRADUATES in Arts or Science, who have pursued certain Biological studies, are admitted to advanced standing. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology, with Bedside Instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M D., LL.D., Professor of Materia Medica, Pharmacy and Gen'l Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITÉRAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat Sc.D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D, Professor of Hygiene.

For Catalogue and announcement containing particulars apply to

DR. JOHN MARSHALL, Dean,
36th St. and Woodland Avenue, Philadelphia.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the 20th of September, 1892, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1893, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to

PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of

ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE AND CURABLE.

Applications and all inquiries should be addressed

T. D. CROTHERS, M.D.,

To which all orders should be addressed.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)."

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

BENZONAPHTHOL-SCHERING

chemically pure
intestinal antiseptic

SCHERING'S

FORMALIN

THE NEW HARMLESS GERMICIDE

Has a germicidal action superior to Corrosive Sublimate without its toxicity.

THIS LIQUID MIXES IN ALL PROPORTIONS WITH WATER

At ordinary temperature even, FORMALIN gives off Gaseous, Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. Stahl, Berlioz, and Frillat, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. Stahl's observations that after one hour's exposure to one per mille, or a quarter of an hour's exposure to $1\frac{1}{3}$ per mille solution of FORMALIN, the most resistant forms of micro-organisms were destroyed. FORMALIN, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

FORMALIN may be applied in 1 per cent. solutions, by spray diffusers, without damage to furniture, metal or materials.

FORMALIN is supplied in one pound bottles.

CELERINA

NERVE TONIC, STIMULANT AND ANTISPASMODIC.

FORMULA.—Every Fluid Drachm represents FIVE grains EACH—Celery, Coca, Kola, Viburnum and Aromatics.

INDICATIONS.—Loss of Nerve Power (so usual with Lawyers, Preachers, Writers and Business Men), Impotency, Spermatorrhea, Nervous Headache, Neuralgia, Paralysis, Hysteria, Opium Habit, Inebriety, Dyspepsia, and ALL LANGUID conditions of the System.

Indispensable to restore a patient after alcoholic excess.

DOSE.—One or two Teaspoonfuls three or more times a day, as directed by the Physician.

ALETRIS CORDIAL

UTERINE TONIC AND RESTORATIVE.

PREPARED FROM THE ALETRIS FARINOSA OR TRUE UNICORN.

INDICATIONS.—Amenorrhea, Dysmenorrhea, Leucorrhea, Prolapsus Uteri, Sterility, to PREVENT Miscarriage, Etc.

DOSE.—One Teaspoonful three or four times a day.

Unrivaled as a Uterine Tonic in Irregular, Painful, Suppressed and Excessive Menstruation.

It Restores Normal Action to the Uterus, and Imparts Vigor to the Entire Uterine System.

Where Women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

S. H. KENNEDY'S

CONCENTRATED EXTRACT OF

PINUS CANADENSIS

DARK. A NON-ALCOHOLIC LIQUID. WHITE.

A MOST VALUABLE NON-IRRITATING MUCOUS ASTRINGENT.

INDICATIONS.—Albuminuria, Diarrhea, Dysentery, Night-Sweats, Hemorrhages, Profuse Expectoration, Catarrh, Sore Throat, Leucorrhea, and other Vaginal Diseases, Piles, Sores, Ulcers, Burns, Scalds, Gonorrhea, Gleet, Etc.

When Used as an Injection, to Avoid Staining of Linen, the WHITE Pinus should be used,

RECOMMENDED BY PROMINENT EUROPEAN AND AMERICAN PHYSICIANS.

The above preparations are prepared exclusively for Physicians' Prescriptions, and a sample of each or all of them will be sent to any Physician who wishes to test them, if he will pay the Express Charges.

PRICE:—75c. per gross; 3 gross for $2.00.
Postage paid.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

HEALTH! **REST!**

TO PHYSICIANS

Desiring to send patients away from home for change of scene, in connection with systematic regimen and oversight.

THE JACKSON SANATORIUM

offers exceptional advantages and attractions.

This institution is under the personal care of a permanent staff of regularly educated and experienced physicians.

Location, 1,200 feet above sea level, in a woodland park, overlooking charming upland and valley views of Genesee region. Pure spring water from rocky heights. Clear, dry atmosphere, free from fogs and malaria. Perfect drainage and sewerage systems. Delightful walks and drives.

Elegant (brick and iron) fire-proof main building and twelve cottages, steam heated, and designed to meet every requirement of invalids, or seekers of rest and quiet.

Extensive apartments for treatment arranged for individual privacy. Skilled attendants. All forms of baths, Electricity, Massage, Swedish Movements, etc., scientifically administered.

Culinary Department under Supervision of Mrs. Emma P. Ewing, Superintendent of the Chautauqua Cooking School, whose reputation as a teacher of scientific and hygienic cooking is national.

Comfort without care; freedom from taxations of fashionable life and from the excitements and temptations of popular resorts. Especial provision for quiet and rest, also for recreation, amusement, and regular out-door life.

Telegraph, telephone, electric bells, safety elevator, open fires, and all modern appliances for comfort and health. On direct line of Del. Lack. & West. R. R. between New York City and Buffalo. Only 9 hours from New York.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

Beaford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional froubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

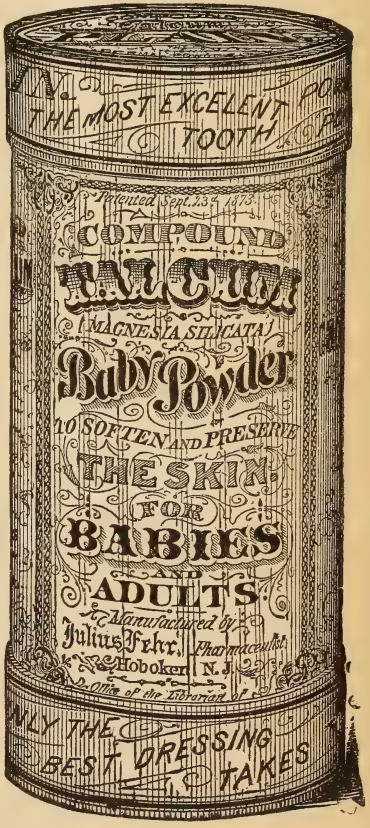
MANUFACTURER:

JULIUS FEHR, M.D.,

Ancient Pharmacist, **HOBOKEN, N. J.**

Only advertised in Medical and Pharmaceutical prints.



Chapping, Itching, Dandruff,

Odors from Perspiration, etc. Speedy Relief by Using

Packer's Tar Soap.

The only prominent Emulsion of Cod-Liver Oil introduced directly to the medical profession. It is advertised exclusively in medical journals.

HYDROLEINE.

(HYDRATED OIL.)

Produces rapid increase in Flesh and Strength.

FORMULA.—Each Dose contains:			
Pure Cod Liver Oil.....80 m. (drops)		Soda.....1-3 Grains.	
Distilled Water.....35 "		Salicylic Acid.....1-4 "	
Soluble Pancreatin..... 5 Grains.			

Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach.

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

HYDROLEINE (Hydrated Oil) is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:)

Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.

TO BRAIN WORKERS of all classes, **HYDROLEINE** is invaluable,—supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

SOLD BY DRUGGISTS GENERALLY.

SOLD BY LEADING DRUGGISTS.

Laboratory, 28 Prince St., New York.

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails.

A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc.

THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

MAIL US YOUR Name and Address and we will send book of TESTIMONIALS.

Prepared only by THE TILDEN CO., New Lebanon, N. Y.

ESTABLISHED 1848 INCORPORATED 1893

Exercises a specific alterative action on the uterine tissues, a general tonic influence on the Pelvic Organs; has a tendency to absorb plastic deposits, to regulate the vascular supply, to relieve congestion, to tone up the nerve forces, to encourage peristalsis of the bowels, and to remove spasmodic conditions.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp , C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of poly-pharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

A *Reconstructive* and *Tonic* for *Convalescents*

Physicians are sending us testimonials, daily, of the excellence of *McArthur's Syrup* as a chemical preparation, a prophylactic or a therapeutic.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., and W. F, WAUGH, M. D., of Philadelphia, and many more Eminent Physicians.

For successful Hypophosphite treatment prescribe thus: Syr. Hypophos. Comp., C. P. McArthur.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. It contains many testimonials.

McARTHUR HYPOPHOSPHITE CO.

BOSTON.

Upon receipt of twenty cents in stamps, we will mail to anyone our Standard Diary for 1893, containing Calendar, Obstetric Ready Reckoner, Antidotes for Poisons, Important Incompatibles, Disinfectants, Weights and Measures, average and maximum doses of Drugs and a Standard Diary with blank pages for memoranda.

McARTHUR HYPOPHOSPHITE CO., Boston, Mass.

SEASONABLE SPECIALTIES

We have pleasure in announcing a most eligible Pill formula entitled CHALYBEATE COMPOUND IMPROVED (Jarvis): Iron Sulph. Exsic., 1½ grs.; Potass. Carbonate, 1½ grs.; Ext. Nux Vomica, $\frac{1}{10}$ gr.

As Cardiac Tonics and Hæmatinics, Iron and Nux Vomica are resorted to more often than any other drugs. According to Lauder Brunton, the alkaloid of Nux Vomica—Strychnia—is one of the best gastric tonics in dyspepsia where there is a tendency to catarrh and congestion, It prevents frontal headache, is an appetizer, a respiratory stimulant, relieves the night sweats of phthisis, serves admirably in mental overwork, sexual debility, hysteria and chorea, and in many forms of paralysis, including the infantile variety.

A MODERN METHOD OF MEDICATION.

Among the many methods of administering medicaments, the Soluble Elastic Gelatin Capsule is growing to be one of the most favored.

Few physicians are aware of the many medicaments that are now administered in this way. Among these one need only mention the following to indicate the wide application of this method of giving numerous drugs:

Apiol; Balsam Fir; Balsam Peru; Cascara Sagrada; Castor Oil and Podophyllin; Chaulmoogra Oil; Cod-Liver Oil and Iodine; Cod-Liver Oil and Iodoform; Cod-Liver Oil and Iron; Cod-Liver Oil and Phosphorus; Copaiba; Copaiba and Cubeb; Copaiba, Cubeb, and Buchu; Copaiba, Cubeb, and Iron; Copaiba, Cubeb, and Matico; Copaiba, Cubeb, Matico, and Sandal; Copaiba, Cubeb, and Sandal; Copaiba, Cubeb, and Sarsaparilla; Copaiba and Iron; Copaiba, Cubeb, and Turpentine; Copaiba and Sandal; Creasote (beechwood), 1 minim; Eucalyptus Oil; Gurjun Balsam; Linseed Oil; Liquor Sedans; Male Fern and Kamala; Nytroglycerin, 1-100 grain; Oil of Pennyroyal; Pichi Extract; Salol; Tar, purified; Valerian Oil; Warburg's Tincture; Wintergreen Oil; Wormseed Oil; Quinine Muriate and Sulphate.

ANTISEPTICS AND DISINFECTANTS.

The prevention of disease is the unselfish mission of the modern physician. Antiseptics and Disinfectants to-day occupy the first place in medical and surgical practice.

We desire to call attention to the following Antiseptic and Disinfectant preparations:

Antiseptic Liquid arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be used in cellars, barns, out-houses, and the sick-room.

Antiseptic Tablets are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

Eucalyptus and Thymol Antiseptic is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited.

Sulphur Candles thoroughly employed are effectual in the fumigation and disinfecting of rooms after infectious diseases.

Correspondence regarding any of our pure and accurate preparations of standard pharmaceuticals and specialties solicited.

PARKE, DAVIS & CO.,

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

Mellin's Food
For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

Beaford Springs Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

I write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1893.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

EUROPHEN

SUBSTITUTE FOR IODOFORM.

AS an antiseptic dressing and cicatrisant in minor and general surgery, and as an eligible application for ulcerative or catarrhal conditions of the membranous tissues, Europhen, or isobutylorthocresoliodide, heads the list of topical remedies. In lesions of a specific character, whether of recent origin or of long standing, Europhen gives prompt and gratifying results. For chronic ulcers of the leg, fistulæ and burns, Europhen is an unrivalled application; and it may be advantageously employed in all cavital troubles ordinarily treated by iodoform, or the antiseptics. Europhen has an agreeable odor; it covers five times more surface than iodoform; and it adheres firmly to lesions to which it is applied. Supplied in ounces.

NOTE THE FOLLOWING.

Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

VIN MARIANI

"The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, . $6.00.

UNIVERSITY OF PENNSYLVANIA.

MEDICAL DEPARTMENT.

THE 128TH ANNUAL WINTER SESSION will begin Monday, Oct. 2d, 1893, at 12 M., and will end at Commencement, June 5th, 1894 THE PRELIMINARY AND SPRING SESSIONS have been discontinued.

The curriculum is graded and attendance upon four annual winter sessions is required. College GRADUATES in Arts or Science, who have pursued certain Biological studies, are admitted to advanced standing. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology, with Bedside Instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and Gen'l Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITÉRAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat Sc.D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D , LL.D, Professor of Hygiene.

WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

PIPERAZIN

URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

Caution:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

"PIPERAZIN (SCHERING)."

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

Calculi Dissolved

BY THE

Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

Dr. John Herbert Claiborne, of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.

DIABETINE-SCHERING

The only innocuous and palatable sugar for diabetics.

BENZONAPHTHOL-SCHERING

chemically pure
intestinal antiseptic

SCHERING'S

FORMALIN

THE NEW HARMLESS GERMICIDE

Has a germicidal action superior to Corrosive Sublimate without its toxicity.

THIS LIQUID MIXES IN ALL PROPORTIONS WITH WATER

At ordinary temperature even, FORMALIN gives off Gaseous, Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. Stahl, Berlioz, and Frillat, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. Stahl's observations that after one hour's exposure to one per mille, or a quarter of an hour's exposure to 1½ per mille solution of FORMALIN, the most resistant forms of micro-organisms were destroyed. FORMALIN, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

FORMALIN may be applied in 1 per cent. solutions, by spray diffusers, without damage to furniture, metal or materials.

FORMALIN is supplied in one pound bottles.

DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

Phytoline

A POWERFUL ANTI-FAT.

Phytoline is now recognized by the Medical Profession as being the only remedy in the Treatment of Obesity that will absorbe the fatty tissue in a great degree without any evil after-effects whatsoever.

The PUREST and HIGHEST TEST PEPSIN

ever introduced.

We now manufacture and offer to the Medical Profession the

Webber-Pepsin, S. & D.

Standard

1:6000.

A Soluble,
Non-Hygroscopic,
Inodorous,
Permanent Pepsin.

The Webber-Pepsin will completely digest 6000 times its weight of coagulated egg albumen, by the U. S. P. test or that of the National Formulary.

It is not a Peptone-Pepsin, yet it is perfectly soluble, being free from mucus and inert putrescible matter, and is so palatable that the most fastidious patient will take it readily.

It is entirely free from septic contaminations, or other products of decomposition.

Special attention is directed to its perfect solubility, permanency and high digestive power.

Physicians will appreciate these several advantages as possessed solely by the Webber-Pepsin. We invite critical comparative tests with other high grade Pepsins.

We prepare the Webber-Pepsin in Granular form and in Scales, both identical as to strength and purity, but, unless otherwise specified, we invariably furnish the GRANULAR form, as this is more convenient for dispensing.

☞ Samples sent to physicians upon application.

The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

"SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

DR. WM. A. HAMMOND'S
PRIVATE HOSPITAL

FOR

DISEASES

OF THE

NERVOUS SYSTEM

WASHINGTON, D.C.

The Hospital is situated on Columbia Heights, at the corner of Fourteenth Street and Sheridan Avenue. The position is the highest in the immediate vicinity of Washington. The soil is dry and all the surroundings are free from noxious influences. The Fourteenth street cablecars run almost to the door. The building is very large, and in its construction every sanitary requirement has been fulfilled. The number of patients is limited to twenty. Electricity in all its forms, baths, douches, massage, inhalations, nursing, etc., are provided as may be required by patients, in addition to such other medical treatment as may be deemed advisable. The building is heated throughout by steam. For further information Dr. Hammond can be addressed at the

HOSPITAL, 14TH ST. AND SHERIDAN AVE., WASHINGTON, D.C.

METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

FOR FATIGUE OF MIND OR BODY

Made from Fresh Coca Leaves and the Purest Wine

RECOMMENDED FOR

NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.

As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

Bedford Springs

Mineral Water

NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

Dear Doctor: I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

Dear Sir: I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

Washington, D. C., April 17, 1895.

Dear Sir: It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

The Springs Hotel is open from June until October.

COLDEN'S LIQUID BEEF TONIC

AN INVALUABLE AID IN MEDICAL PRACTICE.

ORIGINAL | COLDEN'S LIEBIG'S LIQUID EXTRACT OF BEEF AND TONIC INVIGORATOR. | LABEL.

ESSENTIALLY DIFFERENT FROM ALL OTHER BEEF TONICS. UNIVERSALLY ENDORSED BY LEADING PHYSICIANS.

This preparation, consisting of the Extract of Beef (prepared by Baron Liebig's process), the best Brandy obtainable, soluble Citrate of Iron, Cinchona and Gentian is offered to the Medical Profession upon its own merits. It is of inestimable value in the treatment of **Debility, Convalescence from Severe Illness Anæmia, Malarial Fever, Chlorosis, Incipient Consumption, Nervous Weakness,** and maladies requiring a Tonic and Nutrient. It is quickly absorbed by the Stomach and upper portion of the Alimentary Canal, and therefore finds its way into the circulation quite rapidly.

COLDEN'S LIQUID BEEF TONIC appeals to the judgment of intelligent Physicians in the treatment of

ALL CASES OF GENERAL DEBILITY.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of Soluble Citrate of Iron, and which is designated on the label, **"With Iron, No. 1;"** while the same preparation, **Without Iron,** is designated on the label as **"No. 2."**

In prescribing this preparation, physicians should be particular to mention *"COLDEN'S,"* viz., *"Ext. Carnis Fl. Comp. (Colden's)"* A Sample of **COLDEN'S BEEF TONIC** will be sent free on application, to any physician (enclosing business card) in the United States. ***Sold by druggists generally.***

MELLIER DRUG CO NO 109 WALNUT ST. ST LOUIS MO.

McARTHUR'S SYRUP

[Syr. Hypophos. Comp, C. P. McArthur.]

Is a standard and reliable preparation, as proved by the test of years.

The reason why it has attained this enviable reputation is because of its *chemical purity* and the *scrupulous care* taken in its preparation. It is not a conglomerate mass of poly-pharmacy but embodies the valuable therapeutical properties of the hypophosphites of lime and soda, without other objectionable ingredients.

A *Reconstructive* and *Tonic* for *Convalescents*

Physicians are sending us testimonials, daily, of the excellence of *McArthur's Syrup* as a chemical preparation, a prophylactic or a therapeutic.

Used with great success in *Consumption, Tuberculosis, Scrofula, Cough, Brain Exhaustion, Alcoholism, Impotence and General Debility.*

Endorsed by PROF. H. L. BYRD, and PROF. JOHN S. LYNCH, of Baltimore; J. MONTFORT SCHLEY, M. D., of New York; GERTRUDE G. BISHOP, M. D., of Brooklyn; JOHN DIXWELL, M. D., Boston; F. LESIEUR, M. D., and W. F, WAUGH, M. D., of Philadelphia, and many more Eminent Physicians.

For successful Hypophosphite treatment prescribe thus: Syr. Hypophos. Comp., C. P. McArthur.

Sold only in 12 ounce bottles, never in bulk.

Send for pamphlet treating on the use of the Hypophosphites. It contains many testimonials.
